Examination				X E 100%

Module Category

CM Context module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

English level B2 (CEFR)

Brief course description of module objectives and content

The goal of this module is to help students to further develop their knowledge and skills in academic writing and presenting through the medium of English. Students will learn what it means to write advanced academic texts and to present them to an audience in an accurate, appropriate and convincing manner. The module is divided into a writing and a speaking part.

The writing part of the module focuses on key document types students are expected to master in their academic and professional careers. Using examples and engaging students in practical exercises, the writing part particularly highlights the importance of the academic argument, analysing its structure, components and styles. It looks at how arguments can be built into bigger text blocks that form part of academic text types such as

abstracts, introductions, analyses, and others.

The speaking part of the module focuses on how to prepare and deliver academic presentations. How much detail is necessary? Which sources should be referenced? What information should be included in the presentation slides? How do I create interest in the topic? In this second part of the module, the emphasis will be placed on argumentation techniques but also highlight appearance, self-confidence, clarity and orientation to the audience.

Students are encouraged to work on real writing and presentation projects in English as part of the course.

Aims, content, methods

Learning objectives and acquired competencies

At the end of the module, students are able

- to produce advanced academic texts in writing and speaking, paying attention to accuracy, argumentation and the intended target audience;
- to reflect critically on the quality of academic texts, both in speaking and writing, referring to relevant theories;
- to assess their own writing and presentation abilities, using appropriate instruments for self-assessment;
- to define pathways for future development in the area of academic writing and presenting.

Contents of module with emphasis on teaching content

Academic writing

- Academic writing style (vocabulary, sentence formation, linking, etc.)
- Academic text types and their structure
- Academic publishing
- Academic argumentation
- Reader orientation in writing
- Writing as a process in applied research

Academic presenting

- Presenting as telling a story
- Visual and textual aids during presentation
- Rhetorical clarity
- Presenting in a convincing and enthusiastic manner
- Handling stage fright

Teaching and learning methods

- Blended learning, plenary lectures
- Self-study project work in small groups

Literature

A reader will be provided at the start of the semester.

Assessment

Certification requirements

Module uses certification requirements

Certification requirements for final examinations (conditions for attestation)

Two in-semester project assignments, both have to be rated "sufficient" by the lecturers

Assignment 1

- Collaborative writing project in small group

Assignment 2

- Collaborative presentation in small group

(Alternatively: Two in-semester project assignments, which will be graded separately. The projects count 30% towards the final grade; the final written exam counts 70%).

Basic principle for exams

As a rule, all the standard final exams for modules and also all resit exams are to be in written form

Standard final exam for a module and written resit exam

Kind of exam

written

Duration of exam

120 minutes

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic Knowledge in Project Management

Brief course description of module objectives and content

The goals of an organization can be efficiently pursued only through proper project management, as a mean able to consistently tackle their needs. Thus the role of the Project Manager become essential, as responsible to achieve the objectives, respecting the constraints determined by the project context. Modern Project Managers must have in-depth technical and management knowledge.

The course provides the students with the main tools and methods to manage projects and to analyse the organizational context, to provide useful information that can translate into organizational improvements and increased efficiency in the pursuit of business objectives. The course gives also the opportunity to certificate the knowledge acquired in project management with the CAPM certification (Certified Associated in Project Management) provided by the PMI (Project Management Institute).

Aims, content, methods

Learning objectives and acquired competencies

- understand the project management lexicon to communicate in a correct way
- provide theoretical and practical knowledge for proper and integrated project management
- define the project plans to plan and manage the project
- define the project life cycle to improve the project strategy
- define the main tools and techniques to manage the project
- define the processes and the related work flow for an efficient project management
- understand the power of knowledge to improve the results of the organization

Contents of module with emphasis on teaching content

- Project introduction to understand the context
- Terminology introduction to use a common lexicon
- Scope and objectives definition to define requirements, assumptions and constraints
- Definition and use of the WBS (Work Breakdown Structure) to define the main components of the project
- Time management to define project activities, critical path and project schedule
- Cost management to define project budget and the project contingency
- Control management to protect the plans with the Earned Value Management System

Teaching and learning methods

Front lessons – to better understand the content of the lessons: best practices and exercises

Test Case – to be developed in little group or by themselves

Content Test – to understand the knowledge of the concepts of the previous lessons

Project work – to develop a project in little group applying the contents of the lessons

Examination		X F 100%		X E 100%

Module Category

CM Context module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Brief course description of module objectives and content

One of the biggest challenges encountered in management is recognizing opportunities and making use of them while giving consideration to the associated risks. The constantly increasing dynamism and complexity of the environment in which companies and organizations operate is, however, making it difficult to take successful decisions. Multifactorial correlations, non-linearities, feedback effects and time lags make it difficult to correctly predict the impacts of a decision.

Students gain insight into the methods and tools employed for decision-making when faced with complex questions. They learn about cause-and-effect diagrams and quantitative simulation models and apply these in case studies.

Aims, content, methods

Learning objectives and acquired competencies

Students

- are familiar with the systemic approach, can correctly identify the limits of a system and are aware that models only depict reality imperfectly
- are able to analyze complex processes applying the correct methodology and communicate about them
- know how to manage conflicts of objectives with the correct methodology (e.g. costs versus quality)
- can depict complex processes as a cause-and-effect network
- can depict technical and operational processes in the form of an event-orientated simulation model
- are familiar with the most important steps of a simulation study
- understand the problem-solving cycle as a creative process
- have learned to implement systemic problem-solving methods in operational practice

Contents of module with emphasis on teaching content

1. Basics of types of decision, decision making process and six sources of influence
2. Shared mental models
3. Introduction to system dynamics (causal loop diagrams, stocks and flows, analysis of dynamic system behavior)
4. Simulation paradigms applied to understand behavior of dynamic systems governed by human decisions

Teaching and learning methods

Lecture with examples to be solved in a group. Exercises and case studies.

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Brève description du contenu et des objectifs

L'un des plus grands défis du management consiste à identifier et à percevoir les opportunités tout en pesant les risques qui y sont associés. L'augmentation incessante du dynamisme et de la complexité de l'environnement où évoluent les entreprises et les organisations complique la prise de décisions judicieuses. Les interactions multifactorielles, les non-linéarités, les rétro-actions et les décalages dans le temps rendent difficile de prévoir correctement les répercussions d'une décision.

Une introduction aux méthodes et aux outils de prise de décision face à des questions complexes est présentée aux étudiants. Ces derniers se familiarisent notamment avec les diagrammes de causes et effets, les modèles de simulation quantitatifs et les appliquent dans des études de cas.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants

- connaissent les approches systémiques, savent identifier les limites d'un système et sont conscients que les modèles représentent toujours la réalité de façon imparfaite
- sont en mesure d'analyser correctement et méthodiquement des processus complexes et de communiquer dessus
- savent gérer méthodiquement des conflits d'objectifs (p. ex. coût contre qualité)
- peuvent représenter des processus complexes sous forme de réseau de causes et effets
- peuvent représenter des processus techniques et organisationnels sous forme de modèles de simulation par type d'événement
- connaissent les principales étapes d'une étude de simulation
- comprennent le cycle de la résolution de problème comme un processus créatif
- ont appris à mettre en pratique opérationnelle des méthodes de résolution de problème systémiques

Contenu des modules avec pondération du contenu des cours

1. Bases des types de décision, processus de prise de décision et six sources d'influence
2. Modèles mentaux partagés
3. Introduction à la dynamique des systèmes (diagrammes de boucles causales, flux et stocks, analyse du comportement dynamique)
4. Paradigmes de simulation appliqués à la compréhension du comportement de systèmes dynamiques régis par des décisions humaines

Méthodes d'enseignement et d'apprentissage

Enseignement frontal avec des exemples à résoudre en groupe. Exercices d'application et études de cas.

Brief course description of module objectives and content

In the module « Corporate Management and Entrepreneurship », students are enabled to evaluate business models. They learn the building blocks of a business model and elements of sustainable management practices. Along the business model, relevant aspects from different fields such as strategy, marketing, finance and organization are relevant.

Aims, content, methods

Learning objectives and acquired competencies

Business model

- Students know the elements of the business model and are able to visualize and analyse the elements of it.
- Students are able to develop a business model for a new business idea.

Strategy and management

- Students know the most important instruments of Strategic Management.
- Students can apply instruments and make evaluations of organizations.

Finance

- Students know a selection of relevant financial performance indicators.
- Students are familiar with various corporate financing tools and know which ones are strategically adapted to their level of development.

Marketing

- Students have a comprehensive understanding of marketing concepts for decision-making in practice.
- Students are able to develop the course of action for specific marketing goals, strategies and measurements.

Organisation

- Students know the basic concepts of organizational structures and processes.
- Students are able to analyse organizational decision and design situations and develop appropriate solution approaches.

Contents of module with emphasis on teaching content

Business model

- Business model : Elements and building blocks
- Customer segments and channels
- Product development process

Strategy

- Organizational strategies
- Internal and external analysis of enterprises

Marketing

- Market system and marketing
- Course of action and marketing goals

Organisation

- Organizational structure and processes
- Design approaches in organizations

Finance

- Financing (cost structure and cash flow planning)
- Sources of financing and types of financing

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Connaissances fondamentales en gestion de l'entreprise

Brève description du contenu et des objectifs

Dans le cadre du module Management d'entreprise et entrepreneuriat, les étudiants apprennent à jauger et évaluer les entreprises et leurs business modèles. Les étudiants connaissent les principales composantes d'un business modèle et de la gestion durable d'entreprise.

C'est au sein du business modèle que sont élaborés les principaux aspects de la stratégie (analyse interne et externe), le marketing, le financement et l'organisation de l'entreprise.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Business modèle

- Les étudiants connaissent les éléments composant un modèle économique et sont en mesure de représenter et d'analyser ces éléments pour des entreprises choisies.
- Les étudiants sont capables de concevoir un business modèle adapté pour une idée économique nouvelle.

Stratégie et gestion d'entreprise

- Les étudiants connaissent les principaux outils du management stratégique
- Les étudiants peuvent mettre en pratique des outils stratégiques sur des situations données et procéder à des évaluations stratégiques simples.

Gestion financière d'entreprise

- Les étudiants connaissent une sélection d'indicateurs financiers pertinents
- Les étudiants connaissent divers outils de financement de l'entreprise et savent lesquels sont adaptés d'un point de vue stratégique, en fonction du niveau de développement.

Marketing

- Les étudiants s'inspirent d'une conception du marketing globale qu'ils ont intégrée et la mettent en pratique sur des situations et des prises de décision.
- Les étudiants sont en mesure d'élaborer des options d'action pour des entreprises en concevant des objectifs, des stratégies et des mesures de marketing concrets et coordonnés entre eux.

Organisation

- Les étudiants connaissent les concepts fondamentaux de l'organisation structurelle et procédurale.
- Les étudiants sont en mesure d'analyser des situations de prise de décision liée à l'organisation et d'aménagement de l'organisation à l'aide des concepts appris et de concevoir des propositions de solution adaptées.

Contenu des modules avec pondération du contenu des cours

Business modèle

- Modèle économique et de gestion: Eléments et composantes
- Segments de clientèle et canaux de distribution
- Réalisation de la prestation et procédé de développement de produits

Stratégie

- Stratégies d'entreprise, développement de stratégie, mise en œuvre de la stratégie
- Analyse interne et externe de l'entreprise

Marketing

- Système de marché et marketing
- Options d'action et objectifs marketing

Organisation

- Organisation structurelle et procédurale
- Options d'aménagement dans les organisations

Gestion financière de l'entreprise

- Financement (structure des coûts et plan de trésorerie)
- Sources de financement et types de financement

Méthodes d'enseignement et d'apprentissage

Enseignement frontal pour les cours magistraux (2 leçons)

Cours en séminaires pour les exercices (études de cas) (1 leçon)

Etude autonome (analyse des études de cas)

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Brief course description of module objectives and content

In an environment that is changing increasingly quickly, students will be taught the ability to assume societal responsibility either as engineers or in management functions in companies. They will develop a profound awareness of the moral and ethical aspects of their actions and also for the ecological and social impacts of companies. In their subsequent professional careers, they will be better able to judge the consequences of their work for society, to deal with conflicts in these areas, and to contribute to the Corporate Responsibility philosophy of their organisations in a manner appropriate to their positions.

Aims, content, methods

Learning objectives and acquired competencies

- The students know the theoretical foundations of various ethical philosophies
- The students are familiar with various levels of ethics (individual ethics versus corporate ethics)
- The students can apply different ethical approaches in a specific situation
- The students are familiar with the concept of the broader societal Corporate Responsibility of organisations
- The students are familiar with the main elements of the implementation of Corporate Responsibility in companies
- The students are able to analyse and critically judge the Corporate Responsibility philosophy of a given company on the basis of publicly available information

Contents of module with emphasis on teaching content

The courses of development of moral values (virtues) and systematic ethical concepts (norms) in the history of philosophy:

Ethics

- Fundamental ethical concepts
- Ethics of duties and ethics of consequences; human rights; the common good
- Discourse ethics; justice; forming ethical judgements
- Ethics of the environment and the future; sustainability
- Ethics of technology; estimating the consequences of technology, technology assessment
- Ethics codices, guidelines, professional norms
- Specific case studies from various disciplines

Corporate Responsibility:

- The role of organisations/companies in society
- The expectations of stakeholder groups and dealing with these expectations (Stakeholder Management)
- "Corporate Responsibility": The various concepts of responsibility, Corporate Social Responsibility–CSR (various theoretical approaches), sustainability (Brundtland/Rio'92), "Triple Bottom Line" (Elkington, Savitz), Capital Stock Model (World Bank, IIRC), Corporate Citizenship CC
- Corporate Responsibility in the ecological, social, economic and technological areas (sample topics), business case for CSR/sustainability
- Elements of the implementation of corporate responsibility (issue identification, governance, guiding philosophy/policy, issue strategies, measurement and monitoring, non-financial reporting, auditing and certification)

Teaching and learning methods

Lecture, case studies, individual and group projects

Compétences préalables

Connaissances préalables, compétences initiales

Brève description du contenu et des objectifs

Dans un environnement au changement de plus en plus rapidement, les étudiant(e)s sont habilités, tant en tant qu'ingénieur(e)s que dans des fonctions de cadres de l'entreprise, - assumer une responsabilité sociale. Ils sont pour cela sensibilisés de manière approfondie avec des aspects moraux et éthiques de leur action ainsi que pour les répercussions écologiques et sociales d'entreprises. Dans la vie professionnelle, ils seront ainsi mieux en mesure d'évaluer les conséquences de leur travail pour la société, de venir à bout de conflits et d'apporter la contribution inhérente à leur fonction à l'approche de Corporate Responsibility de leur organisation.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- les étudiant(e)s connaissent les principes théoriques de différentes approches éthiques;
- les étudiant(e)s connaissent divers niveaux éthiques (éthique individuelle contra éthique d'entreprise);
- les étudiant(e) peuvent appliquer différentes approches éthiques dans une situation concrète;
- les étudiant(e)s sont familiarisés avec l'idée d'une responsabilité sociale étendue d'organisations («Corporate Responsibility»);
- les étudiant(e)s connaissent des éléments importants de la mise en œuvre de la Corporate Responsibility dans l'entreprise
- les étudiant(e)s sont à même d'analyser et d'évaluer d'un œil critique l'approche de „Corporate Responsibility“ d'une entreprise sur la base des informations publiquement disponibles.

Contenu des modules avec pondération du contenu des cours

Ligne de développement de l'histoire philosophique des valeurs morales (vertus) et des concepts éthiques systématiques (normes):

Ethique

- Notions fondamentales d'éthique
- Ethique du devoir et conséquentialiste; droits de l'homme; intérêt public
- Ethique de la discussion; justice; jugement éthique
- Ethique d'environnement et d'avenir; durabilité
- Ethique technique; évaluation des conséquences de la technique, évaluation de la technique
- Codes d'éthique, directives, normes professionnelles
- Exemples de cas concrets tirés de diverses disciplines

Corporate Responsibility:

- Rôle des organisations/entreprises dans la société
- Les attentes des parties prenantes et la manière de les traiter (Stakeholder-Management)
- „Corporate Responsibility“: divers concepts de responsabilité, Corporate Social Responsibility–CSR (diverses approches théoriques), durabilité (Brundtland/Rio'92), „Triple Bottom Line“ (Elkington, Savitz), modèle du stock de capital (Banque mondiale, IIRC), Corporate Citizenship CC
- Responsabilité de l'entreprise dans la sphère écologique, sociale, économique et technologique (exemples de thèmes), Business Case pour la CSR / durabilité
- Eléments de mise en œuvre de la responsabilité d'entreprise (identification de problèmes, gouvernance, principe directeur/politique, stratégies de problèmes, mesure & contrôle, rapports non financiers, audit & certification)

Méthodes d'enseignement et d'apprentissage

Cours, case studies, travail individuel ou en groupe.

Bibliographie

Il sera renvoyé à la littérature en fonction des langues durant les cours.

Brief course description of module objectives and content

The module describes the economic, social, political, technological and natural framework conditions of the global markets and explains the influence of culture on international business.

Aims, content, methods

Learning objectives and acquired competencies

1. Students understand the process and the impacts of globalization on the economy and society
2. Students are familiar with the economic, social, political, technological and natural framework conditions of the global markets and understand their importance for internationally operating companies
3. Students learn how companies select and work with and within foreign markets
4. Students know the differences between the most important cultural areas and understand their influence on the activity of international companies
5. Students have acquired basic knowledge in dealing with foreign cultures

Contents of module with emphasis on teaching content

The module deals with the globalization of the economy and the opportunities and risks that result from this. It shows how far the economic, social, political, technological and natural framework conditions on international markets differ from each other and what significance these framework conditions have for companies' foreign business.

The module deals with the internationalization process of companies. It shows how companies decide which foreign markets to enter and which form to adopt in dealing with these markets.

The module explains what the term culture means and how far cultures differ from each other. It looks into different forms of communication and problem-solving in different countries and shows what challenges develop in intercultural cooperation in teams and in the management of employees from different cultures.

Teaching and learning methods

Students acquire the basic knowledge required for the topics covered in the module by studying a textbook. The contents of the book are covered in greater depth during the tuition, through examples that illustrate them, the processing of case studies, the discussion of controversial questions, exercises and simulations, and are applied in the context of a project assignment.

Literature

Compulsory reading (to be acquired before the start of the semester):

- Lausanne: Pervez Ghauri, Philip Cateora, International Marketing, 4th European Edition, U.K.: McGraw-Hill Higher Education, 2014.

In-depth reading:

Brief course description of module objectives and content

The module aims to explain the operational planning and management of innovations to students on the basis of an integrated innovation management model, as well as introducing them to the relevant concepts. This will enable students to establish links to various company-internal and company-external interfaces as part of innovation projects and to correctly interpret and influence these. In this module, students will be trained as "innovation managers" in a broad sense.

Aims, content, methods

Learning objectives and acquired competencies

- The module has the following learning aims:
- The students are able to evaluate innovation management concepts in practice, to develop these and to implement adaptations
- The students are able to apply organisational ambidexterity as a management principle along the spectrum between everyday business (exploitation) and renewal (exploration)
- The students are able to communicate various subject areas in innovation management to third parties
- The students can estimate possible disruptive potential and develop suitable measures to harness this potential or to react to it
- The students can analyse and evaluate the innovation process within a company, identify its deficits and gaps, develop improvements on this basis, and implement these
- The students can develop an implementation plan for an innovation project as a risk-reduction process and take on responsibility for the implementation of this plan
- The students are familiar with more agile approaches as a stage gate for the development of products (services and material goods) and can judge which approach is to be selected for which development

Contents of module with emphasis on teaching content

The Innovation and Change Management module deals with the following topics:

- Foundations: definition and contents; types of innovations, commercial and economic importance of innovations
- Innovation system: international, national, regional innovation systems and the most important innovation promotion instruments
- Innovation cycle: innovation management model with innovation routine, dynamic capabilities and strategic areas of activity. Relevance to general management and its methods
- Innovation strategy: strategic fit, strategic alternatives, success factors, imitation strategies, related diversification, co-creation, new venture
- Innovation structure: innovation-friendly process and development organisation, change-capable organisation profiles, open vs. closed innovation
- Innovation culture: innovation-friendly corporate culture, initialisation, conception, mobilisation, implementation and embedding of change, Corporate Entrepreneurship
- Innovation controlling: indices, indicators, BSC approaches, creation and success participation for innovation initiatives
- Definition of terms, structure and history of the innovation process, demarcation of routine and innovation processes
- The dilemma of innovative companies (incremental, radical and disruptive innovations) and possible solutions for this
- Structuring of the corporate innovation process as a phase model
- Structuring of the initiative and selection phases in the innovation process
- Structuring of the implementation phase in the innovation process (development of new products as a risk-reduction process)
- The challenge of the "escalation of commitment" during the implementation phase in the innovation process
- Intangible property law and strategies for the protection of ideas

Teaching and learning methods

Physical presence: teaching discussions, didactic case studies, practical exercises, presentations

Self-study: study of literature, preparations and follow-up, classroom teaching, group projects

The students apply what they have learned with the aid of practical examples by identifying innovation-relevant problems and selecting and correctly using appropriate tools and methods to solve these problems.

aucun

Brève description du contenu et des objectifs

Après une introduction aux différentes notions, le module a pour but d'expliquer aux étudiants la planification opérationnelle et la gestion des innovations à l'aide d'un modèle de gestion de l'innovation intégré. Les étudiants sont alors en mesure d'établir des liens avec des interfaces internes et externes à l'entreprise, de les interpréter et de les influencer. Les étudiants sont formés pour devenir des «managers de l'innovation» au sens large.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Le module poursuit les objectifs suivants:

- Les étudiants sont capables d'évaluer dans la pratique les concepts de gestion de l'innovation de les faire évoluer et de mettre en œuvre des ajustements.
- Les étudiants sont en mesure de gérer l'ambidextrie à la jonction entre l'exploitation et l'exploration comme principe de management
- Les étudiants savent expliquer les différents thèmes de la gestion de l'innovation à des tiers
- Les étudiants peuvent analyser un potentiel disruptif et concevoir des mesures adaptées pour exploiter ce potentiel et savoir y réagir
- Les étudiants sont capables d'analyser le processus d'innovation d'une entreprise, d'identifier les lacunes et les défauts, d'en déduire des améliorations et de les mettre en œuvre
- Les étudiants peuvent concevoir un plan de réalisation pour un projet d'innovation dans le cadre d'une procédure de réduction des risques et prendre des responsabilités dans le cadre de sa mise en œuvre
- Les étudiants connaissent les démarches agiles sous forme de stage-gate pour le développement de produits (prestations de service et biens matériels) et sont capables de juger quelle démarche est plus appropriée en fonction du développement

Contenu des modules avec pondération du contenu des cours

Le module Gestion de l'innovation et du changement aborde les thèmes suivants:

- Bases: notions et contenu; natures des innovations, importance de l'innovation sur le plan à la fois micro- et macro-économique
- Systèmes d'innovation: systèmes d'innovation internationaux, nationaux, régionaux ainsi que les outils de promotion de l'innovation
- Carrefour de l'innovation: modèle de gestion de l'innovation avec une routine de l'innovation, capacités dynamiques et domaines d'activité stratégiques, rapport avec le management général et ses méthodes
- Stratégie de l'innovation: concordance stratégique, alternatives stratégiques, facteurs de réussite, stratégies d'imitation, diversification connexe, co-création, new venture
- Structure de l'innovation: process et procédures favorables à l'innovation, profils d'organisation flexibles, innovation ouverte vs. fermée
- Culture de l'innovation: culture d'entreprise favorable à l'innovation, initialisation, conception, mobilisation, réalisation et mise en étapes du changement, corporate entrepreneurship
- Contrôle de l'innovation: indices, chiffres clés, approches BSC, genèse et participation aux réussites dans le cadre des initiatives innovation
- Définition des notions, structure et histoire des processus d'innovation, délimitation des processus de routine et d'innovation
- Le dilemme des entreprises innovantes (innovations incrémentales, radicales et disruptives) et les solutions possibles
- Conception du processus d'innovation opérationnel sous forme de modèle de phases
- Conception de la phase d'initiatives et de sélection dans le processus d'innovation
- Conception de la phase de réalisation dans le processus d'innovation (développement de nouveaux produits comme processus de réduction des risques)
- Le défi de «l'escalade de l'engagement» durant la phase de réalisation dans le processus d'innovation
- Droit des biens immatériel et stratégies de protection pour la protection des idées

Méthodes d'enseignement et d'apprentissage

Cours présentiels: discussions guidées, études de cas didactiques, exercices, mini-enseignements

Etude autonome: étude de biographie, préparation et révision des cours présentiels, groupes de travail

A l'aide d'exemples tirés de la pratique, les étudiants appliquent ce qu'ils ont appris en identifiant les problèmes liés à l'innovation, en choisissant et en appliquant à bon escient les outils et méthodes adaptés à leur solution.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic Knowledge in production management.

Brief course description of module objectives and content

The course introduces the concepts of Lean innovation and lean thinking. It also fosters a complex serious-gaming session where the students can develop their own factory and implement its innovation path. Indeed, the student will be able to devise and implement a production practice that considers to be waste the expenditure of resources for any goal other than the creation of value for the customer.

Aims, content, methods

Learning objectives and acquired competencies

- understand the lean lexicon
- provide theoretical and practical knowledge for proper Lean Innovation
- define a lean implementation project plan and manage the project
- acquire the main tools and techniques to manage a lean transformation

Contents of module with emphasis on teaching content

- Basic Innovation management (Types of innovation, Technology Acceptance Model, Diffusion Of Innovation, Quantitative model for DOI)
- Lean approach
- Lean Tools
- Lean Implementation
- Serious Game session

Teaching and learning methods

Front lessons – to better understand the content of the lessons: best practices and exercises

Test Case – to be developed in little group or by themselves

Lean Lab – serious gaming to develop a deep understanding of the theoretical concepts

Brief course description of module objectives and content

Companies are increasingly interested in conducting their activities so that a long-term future is assured for its business, society and environment. The purpose of this class is to deal with the well-recognized but sometimes vague concept of sustainability from an engineering perspective. The module is meant to introduce students to the implementation of sustainable management in industries and provide them with tools enabling the enhancement of the sustainability performances of production systems.

Aims, content, methods

Learning objectives and acquired competencies

During lectures, practitioners gain knowledge on the sustainability concept and are educated on its concrete application into the present industrial context. Standards, sustainability assessment tools, reporting systems and best practices are presented as the main instruments to answer market and regulations sustainability requirements raised in the last decades. The approach used to treat the sustainable management of manufacturing systems is a holistic one since all the three sustainability dimensions are addressed (i.e. environment, economy and society) and the industrial activities considered include the design and the management of product, process and supply chain in an integrated way. The course is divided into two main blocks aiming at:

1. Defining what is meant by sustainability and present the role of standards and regulations into sustainable management systems;
2. Providing students with tools allowing to assess, report and communicate on sustainability performances of products and processes. The measure of sustainability level enable to monitor the management system effectiveness and to enhance performances.

Contents of module with emphasis on teaching content

The sustainability concept applied into the industrial context: Course ID -01

- Introduction to sustainability: the concept and its history;
- The elements of sustainability implementation in industry;
- The implementation of Environmental, Health and Safety and Energy Management systems;
- Corporate Social Responsibility;
- Circular Economy concept

Sustainability Assessment, Reporting and Labelling: Course ID -02

- Assessing the environmental performances: the Life Cycle Assessment (LCA);
- The GHG Protocol;
- Environmental labeling of products.

Teaching and learning methods

Frontal theoretical lessons, case studies and exercises supported by the use of software.

Brief course description of module objectives and content

In the Privacy and Law module, students gain an awareness of the threats to privacy in the fast changing digital society and are prompted to reflect on values in the historical and intercultural context.

Students acquire an overview (system and reference knowledge) of actual legal aspects that have not been specifically covered in either the vocational baccalaureate or in the Bachelor's degree course. In the knowledge and information society these are, in particular, the legal aspects private data protection, copyright, brand rights, patents, forms of collaboration in the digital economy, relevant contract setc.

Aims, content, methods

Learning objectives and acquired competencies

Understanding the different dimensions of privacy. Thinking in the corresponding contexts. Transferring privacy aspects to and within the private and work environment and reflecting upon these, establishing links with learning content in the MRU and the technical modules.
Acquiring an appreciation of the legal aspects confronting an engineer in demanding professional situations. Gaining awareness in order to avoid damages due to infringements of rights or legal uncertainty. Acquisition of speaking and listening skills in order to conduct the corresponding specialist discussions with experts.

Contents of module with emphasis on teaching content

- Introduction to law and the privacy aspects of law
- Knowledge of the industry relevant contracts (word & labour, licence, NDA, SLA etc.)
- Ventures in digital environment (forms, GeBüV, Compliance etc.)
- Knowledge of the creation and development of privacy as a fundamental/human right (GDPR included)
- Knowledge of IP-law (copyrights, trade marks, design, patents, unfair competition)
- Knowledge of legal aspects of new technologies as AI, Blockchain etc.
- Formative tests

Brève description du contenu et des objectifs

Le module « Privacy and Law » sensibilise les étudiants aux menaces pesant sur la vie privée dans la société postmoderne et incite à la réflexion sur des valeurs dans les contextes interculturel et historique.

Les étudiants reçoivent une vue d'ensemble (connaissance de système et d'orientation) concernant les aspects juridiques, qui n'ont été spécialement thématiques ni dans le cadre de la maturité professionnelle ni dans les études de bachelor. Dans la société du Savoir et de l'Information, il s'agit là en particulier des aspects juridiques des biens immatériels comme les données, les droits d'auteur, brevets, les droits liés à la marque etc.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Compréhension des différentes dimensions de la vie privée. Penser aux liens entre celles-ci. Transfert et réflexion des aspects de la vie privée sur et dans les environnements privé et professionnel, faire des liens avec les contenus d'apprentissage dans le Master Research Units et les modules techniques.

Sensibilisation à des aspects juridiques, auxquels les ingénieurs sont confrontés dans des situations professionnelles exigeantes. Acquérir une sensibilisation pour éviter des dommages à cause d'atteinte au droit ou d'incertitudes juridiques. Acquisition d'une compétence de discussion et d'écoute, pour pouvoir conduire des entretiens spécialisés appropriés avec des experts.

Contenu des modules avec pondération du contenu des cours

- Introduction au droit et à ses aspects de la vie privée
- Comprendre et réfléchir aux liens entre la protection des données, le droit d'auteur et la vie privée, et à leur interconnexion avec les développements technologiques, connaître les conflits d'objectifs
- Connaître l'apparition et le développement de la notion de «vie privée» dans les droits de l'homme / le droit fondamental
- Connaître les grandes lignes de la protection des données et de la personnalité
- Connaître les concepts du lancement d'alerte
- Connaître les grands principes du droit d'auteur
- Comprendre les possibilités et les limites des répercussions des droits en matière
- Connaître les grandes lignes des contrats importants dans l'industrie
- Connaître grandes lignes du droit des brevets
- Connaître les grandes lignes du droit des marques et du droit sur un design
- Evaluation formative

Brief course description of module objectives and content

The CM_QRM addresses the most relevant basics in integrated quality and risk management. Theory is applied and specified by examples and case studies. The Module concentrates on current standards and best practices on quality and risk management and introduces the most established approaches.

Aims, content, methods

Learning objectives and acquired competencies

The students realise that quality and risk management is an integral guiding process at enterprises that covers quality assurance as well as comprehensive product and system design, development, optimisation.

Quality management

- The students know and understand the close relation of integral QRM in enterprises and organisations.
- They understand that this concerns the change management on organisation level as well as on individual level of staff.
- They know and understand the principles of how to use QM processes.
- They are able to explain the characteristics of most relevant normative quality assurance models.
- They know and understand the most relevant tools and Best Practices in usage, implementation and control of QRM processes.
- They understand the pre-conditions of how to achieve and assure a QM certification.

Risk management

- The students know the most relevant national and international Best Practices and standards in risk management and risk engineering.
- They know the most relevant risk assessment approaches, how to use them and to relate them into the context of operational risk management.
- They understand the concept of integrated risk management: They know significant interfaces to other management processes as well as to the areas of environment, society and policy.
- They are able to conduct exemplary case studies (with regard to risk identification, analysis and evaluation).
- They are able to analyse similar problems, to develop solutions and to evaluate them.

Contents of module with emphasis on teaching content

Quality management QM

- Introduction to Module QRM
- Quality Management (Levels of QM, factors influencing quality, quality improvement, Deming circle, Concept and role of customer satisfaction "Kano Model", Customer Experience Management)
- Process Management System
- Overview of, e.g., specified ISO Norms on QM, environment, safety corporate social responsibility (ISO 9001:2015, ISO 14001:2015, OHSAS 18001:2007, ISO 26000)
- Total Quality Management TQM (Philosophy, connect to Deming)
- Business Excellence (Excellence term, what it stands for, relation to EFQM Model)
- EFQM¹⁾ Model (Fundamental concepts, criteria model, RADAR²⁾ Logic, implementation, innovation processes)
- Synopsis (Review of main aspects in integrated quality management)

¹⁾: European Foundation for Quality Management; ²⁾: Results, Approach, Deployment, Assessment, Refinement

Risk management RM

- Introduction of Basic principles of risk management
- Entrepreneurial RM policy (context, case studies)
- Principles of risk assessment and risk engineering (basic concepts, definitions)
- Qualitative approaches (Fishbone Diagram, Master Logic Diagram, Bow Tie Analysis, Hazard and Operability Study (HAZOP))
- Semi-quantitative approaches (Failure Mode and Effects Analysis (FMEA))
- Quantitative approaches (fault tree analysis, event tree analysis)
- Quantification and data sources
- Risk evaluation (risk matrix, Frequency/Consequence curves)
- Synopsis (Review of main aspects in integrated risk management)

Brève description du contenu et des objectifs

Le module a pour objectif de transmettre les bases fondamentales de la gestion du risque et de la qualité, en concrétisant la théorie par des exemples tirés de la pratique. Outre qu'il s'oriente sur les normes actuelles et les bonnes pratiques en vigueur dans le domaine de la gestion du risque et de la qualité, ce module introduit aux méthodes éprouvées.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiantes et étudiants comprennent que la gestion du risque et de la qualité est un processus de gestion global, ayant plus particulièrement pour objectifs l'assurance qualité ainsi que le développement de l'ensemble des produits et du système.

Gestion de la qualité

- Les étudiantes et étudiants connaissent et comprennent le lien étroit unissant gestion globale de la qualité et gestion du risque dans les entreprises et les organisations.
- Ils comprennent que cette démarche implique une gestion du changement, au niveau de l'organisation d'une part et au niveau individuel des collaboratrices et collaborateurs d'autre part.
- Ils connaissent et comprennent les principes régissant l'application des processus d'assurance qualité.
- Ils sont capables d'expliquer les principales caractéristiques des modèles normatifs d'assurance qualité les plus importants.
- Ils connaissent et comprennent les principaux instruments et les meilleures pratiques en matière d'utilisation, de mise en œuvre et d'évaluation des processus d'assurance qualité.
- Ils comprennent les exigences auxquelles il faut répondre afin d'obtenir et de pérenniser une certification dans le domaine de la gestion de qualité.

Gestion du risque

- Les étudiantes et étudiants connaissent les normes et les standards actuels les plus importants en matière de gestion du risque, aux niveaux national et international.
- Ils connaissent les principales méthodes d'évaluation du risque et sont capables de les utiliser et de les mettre en œuvre dans un contexte de gestion du risque en entreprise.
- Ils comprennent le concept de gestion intégrée du risque : ils connaissent les interdépendances importantes avec d'autres processus de management, ainsi qu'avec l'environnement, la société et la politique.
- Ils sont en mesure d'effectuer des études de cas exemplaires (c'est-à-dire d'identifier, d'analyser et d'évaluer les risques).
- Ils sont capables d'analyser des problèmes analogues, de développer des solutions et de les évaluer.

Contenu des modules avec pondération du contenu des cours

Gestion de la qualité

- Introduction au module relatif à l'assurance qualité
- Gestion de la qualité (niveaux de gestion de la qualité, facteurs influençant la qualité, amélioration de la qualité, cercle Deming, concept et rôle du « modèle de Kano » sur la satisfaction de la clientèle, Management ou Customer Experience)
- Gestion du processus (système de gestion globale du processus)
- Aperçu des normes par ex. spécifiées sur la gestion de la qualité, l'environnement, la sécurité, la responsabilité sociale de l'entreprise (ISO 9001:2015, ISO 14001:2015, OHSAS 18001:2007, ISO 26000)
- Gestion totale de la qualité (philosophie, lien avec Deming)
- Excellence commerciale (terme « excellence », ce qu'il représente, lien avec le modèle EFQM)
- Modèle EFQM¹⁾ (concepts fondamentaux, modèle de critères, logique RADAR²⁾, mise en œuvre, processus d'innovation)
- Récapitulatif (passage en revue des aspects centraux de la gestion de la qualité intégrée)

¹⁾; European Foundation for Quality Management ; ²⁾: Results, Approach, Deployment, Assessment, Refinement

Gestion du risque

- Introduction aux principes fondamentaux de la gestion du risque
- Politique entrepreneuriale de la gestion du risque (contexte, cas de figure)
- Principes de l'évaluation du risque (concepts de base, définitions)
- Méthodes qualitatives (diagramme en arêtes de poisson, Master Logic Diagram, méthode d'analyse dite du nœud papillon, étude HAZOP (Hazard and Operability))
- Méthodes semi-quantitatives (modes de défaillances et de leurs effets, AMDEC (FMEA Failure Mode and Effects Analysis))
- Méthodes quantitatives source de données
- Bases de l'analyse de fiabilité (paramètres de fiabilité, taux de défaillance, sources des données)
- Évaluation du risque (matrice des risques, courbes fréquence/conséquence)
- Récapitulatif (passage en revue des aspects centraux de la gestion du risque intégrée)

Méthodes d'enseignement et d'apprentissage

Enseignement théorique frontal
Travaux dirigés pratiques
Résolution de cas de figure

CM Context module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Prior to joining the module, the students should have an understanding of business process modeling and engineering, e.g., terms like process charts, swimlanes, process models, resources, value chain etc. (see, e.g., the paper of John Krogstie: Introduction to Business Processes and Business Process Modeling, https://link.springer.com/chapter/10.1007/978-3-319-42512-2_1)

Brief course description of module objectives and content**Smart Service Design and Engineering - Value Creation:**

- Basics of Smart Service Design (Customer insight, customer journey, value proposition design, use of data insights)

- Selected topics of Service Science and Service Dominant Logic
- Service blueprinting as a relevant step in the service engineering process
- Characteristics of Data Services and Data Products
- Use of data in the smart service design process and in the services themselves - Smart Data
- data sources
- Iterative improvement up to product maturity
- Discussion of applications in the industrial and the sector
- Discussion of real-life cases

Smart Business Model Design - Value Capturing:

- Fundamentals for Engineering Value Flows in Service Ecosystems and Service Business Models
- From Service Blueprint to Business Model
- Quantification of service business models
- Basics Business Model Design and Business Model Canvas
- Service Ecosystem Design
- Quantification of the business model
- Discussion of real-life cases

Data Protection, Data Security, Data Ethics:

- Fundamentals of data protection and data security
- Relevant aspects for Data Product Design
- Legal aspects vs. ethics
- Discussion of real-life cases

Aims, content, methods

Learning objectives and acquired competencies

- Understand and apply the essential principles of Smart Service Design and Engineering - i.e. the development of intelligent services on the basis of data (comprehensive methods for the development of novel data-driven services, for their operation as well as their improvement in operations).
- Able to integrate the data specific aspects into their service design.
- Apply the methods of data-driven service engineering in practical case studies primarily in industrial environments (B2B), but also in consumer areas (B2C)
- Know and understand the relevant basics of Service Business Model Design including the types of industrial Service Models.
- Evaluate these business models quantitatively. To weigh up variants and draw conclusions about the engineering process with the aim of achieving an operationally and economically balanced model.
- Understand the design of service ecosystems.
- Able to understand the essential principles of data protection, data security, and data ethics.

Contents of module with emphasis on teaching content

CM Context module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge****Brief course description of module objectives and content**

Sustainable development is essential for many parts of modern society. This module provides an overview of the history of sustainable development, of established concepts, as well as of relevant initiatives and organisations globally and in Switzerland. Further, methodologies and tools are introduced for engineers to contribute to sustainable development on a technical level. Students learn the fields of application of the various methods as well as their strengths and weaknesses. They learn to apply the tools to analyze and improve the ecological performance of products and industrial processes.

Aims, content, methods

Learning objectives and acquired competencies

The students ...

- can define the term sustainable development and related concepts and know their similarities and differences as well as their history.
- understand the national and international debates, agendas and policy approaches to sustainable development and are able to consider what they mean in the context of their own field of study.
- are able to identify the roles of important stakeholders in sustainable development decision making.
- are able to analyze the implications of sustainable development for organizations, their executives and employees. Based on cases from various sectors, students are able to develop suitable strategies for action.
- understand what they personally can do to become more socially and environmentally responsible in their future professional and personal lives.
- know and understand different technical concepts to achieve a sustainable economy, sustainable business models and sustainable product design.
- know the most relevant tools for technical sustainability analysis and ecodesign, their fields of applications, strengths and weaknesses.
- are able to select the appropriate methods and tools when confronted with a specific technical sustainability problem.
- are able to interpret results generated with these methods and derive system optimizations.
- are able to identify, analyze and discuss sustainability-related challenges and issues and to develop problem-oriented solutions.
- are able to communicate and enact these solutions confidently and effectively.

Contents of module with emphasis on teaching content

- The global challenge of sustainability. Climate change, the end of the fossil age, planetary boundaries, global footprint.
- Sustainable development goals and their implications, other concepts.
- Organisations, political panels and global structure regarding sustainability and climate change, international negotiations and concepts (e.g. Paris agreement).
- Business concepts and examples of sustainability (Dyllick, GRI, Global Compact etc.)
- National aspects for the transformation (decarbonisation) of the existing building stock and related infrastructure
- Technical concepts to achieve a sustainable economy (industrial ecology, circular economy, etc.)
- Theory and practice of sustainability analysis and ecodesign methodologies and tools (substance flow analysis, life cycle assessment, a.o.)

Teaching and learning methods

- Lectures
- Exercises
- Group discussion
- Moderated plenary discussion
- Post-decision case studies
- Guest speaker
- Reflective paper

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

The module is particularly recommended to students subscribed to one of the following specialization areas:

- Business Engineering
- Energy & Environment
- Medical Engineering
- Mechanical Engineering
- Mechatronics & Automation
- Electrical Engineering
- Data Science
- Computer Science
- Photonics
- Aviation

Brief course description of module objectives and content

The module describes the practical and theoretical framework of Technology Management, and explains the lifecycle of technologies and the related methods in Technology Management.

Aims, content, methods

Learning objectives and acquired competencies

1. Students understand the elements and the application areas of Technology Management.
2. Students are familiar with the practical and theoretical framework of Technology Management and understand the importance for innovative operating companies.
3. Students learn how companies select and work with technologies.
4. Students know how to manage technology throughout its lifecycle phases and understand the influence of technology on profitability and risk exposure for companies.
5. Students know how to deal with stakeholders relevant for Technology Management.

Contents of module with emphasis on teaching content

Technologies are among the most important strategic and operational assets of product and process driven companies. The module deals with mastering technologies to enable companies to achieve competitive advantage and differentiation by sound Technology Management. The focus of the module is on management of technology throughout its lifecycle, thus complementing topics such as Innovation, Solution, Product and Project Management, covering strategic and operational aspects including technology evaluation, planning, development/provision, implementation, distribution, exploitation and dismantling (de- and re-manufacturing). Examples of new technologies will be considered in group work and discussed as practice examples. The module conveys comprehensive knowledge required for TM, e.g. technology trend analysis, technology scouting and recognition, technology roadmapping, lifecycle management, portfolio management, competitive strategies, protection, IPR- and knowledge management, corporate technology management, technology assessment, as well as technology communication and related aspects of effective stakeholder management.

Teaching and learning methods

The module is taught by theory inputs, illustrative examples, case studies, discussion of controversial questions and exercises. Content is applied in the context of a project assignment.

Entry level competences

Prerequisites, previous knowledge

Familiarity with basic discrete math, logic and probability theory. Familiarity with one programming language such as C++, Java, or similar languages.

Brief course description of module objectives and content

Algorithms are at the heart of every computer program. Informally, an algorithm is a procedure to solve a (computational) problem within a finite number of elementary steps. The same problem can be addressed with different algorithms, hence it is important to compare the different options in order to choose the best one. Experimental analysis is one way to perform such comparison, but it has several limits. The main goal of this class is to learn how to analyze the performance of a given algorithm in a formal mathematical way. We will focus on some fundamental polynomial-time-solvable problems. Along the way, we will study some of the main techniques to design efficient algorithms, among which the use of efficient data structures.

Aims, content, methods

Learning objectives and acquired competencies

The main goal of this course is to learn basic techniques to design algorithms and data structures for fundamental polynomial-time-solvable problems, and mathematical tools to analyze their performance from a theoretical point of view.

Contents of module with emphasis on teaching content

A. Analytical tools: worst-case analysis and asymptotic notation; analysis of recursive algorithms; analysis of randomized algorithms; amortized analysis.

B. Algorithmic techniques: greedy; dynamic programming; divide et impera; randomization; fast data structures.

C. Data structures: search trees; priority queues; union-find; hash tables.

D. Polynomial-time problems: sorting and selection; shortest paths; minimum spanning tree; maximum flow; maximum matching.

Teaching and learning methods

Interactive lectures both for theory and exercises.

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

The student has working knowledge of:

- Geometry, linear algebra, algorithms (sorting, searching, hashing) and data structures (linear structures, trees)
- Basics of graph data structures and algorithms
- Algorithmic complexity, logic, probability theory.

These topics are generally contained in books introducing algorithms. For instance, chapters 1-12, 15-17, 22-26, 28-29, 34-35 of (Cormen 09) covers very well the prerequisites

Brief course description of module objectives and content

This module introduces students with different categories of advanced algorithms and typical application areas.

In the first part of the module, the students will have a sound understanding of data structures and algorithms for efficiently handling either very large, complex or dynamic data sets or combinations thereof. They will be able to evaluate suitable algorithms and to apply them to typical tasks such as efficiently indexing, searching, retrieving, inserting or updating data such as large volumes of hypertext or spatial data.

The students will be familiar with dynamic algorithms used, for example, in artificial intelligence.

The second part of the module will present basic techniques for designing algorithms for hard combinatorial optimization problems. The combination of these basic components—problem modeling, problem decomposition, solution building, solution improvement, learning—lead to classical metaheuristics like genetic algorithms, ant colonies or tabu search. The students will be able to design new algorithms for hard combinatorial optimization problems and to apply them.

Aims, content, methods

Learning objectives and acquired competencies

This module gives the student an overview of frequently used algorithms classes. Based on this strong foundation, students can design and implement the most suitable and efficient algorithms for use in their own applications. The student:

- is familiar with different categories of advanced algorithms and with typical application areas;
- has a sound understanding of data structures and algorithms for efficiently handling either very large, complex or dynamic data sets or combinations thereof;
- is able to evaluate suitable algorithms and to apply them to typical tasks such as efficiently indexing, searching, retrieving, inserting or updating data, including data types such as large volumes of hypertext or spatial data;
- is familiar with dynamic algorithms used in robotics, artificial intelligence.

Contents of module with emphasis on teaching content

Algorithms and data structures for selected practical problems. Weight 50%

- Reminder on linear structures, binary search tree, heap and algorithmic complexity
- Randomized algorithms (qsort, selection in linear time, kD tree, range tree, Delaunay triangulation)
- Deterministic algorithms (selection, kD tree)
- Sweep algorithms (closest pair of points, segment intersection)
- Greedy algorithms (Huffman code, Dijkstra, Fibonacci heap)

Design of heuristic algorithms. Weight 50%

- Reminder on complexity theory, combinatorial optimization problems, problem modelling
- Greedy heuristics
- Local search heuristics
- Decomposition methods
- Randomized heuristics
- Learning heuristics
- Classical metaheuristics: GRASP, ant colonies, tabu search, simulated annealing, noising methods, genetic algorithms

Teaching and learning methods

- Ex-cathedra teaching
- Presentation and discussion of case studies
- Problem-based learning
- Theory and programming exercises

FTP bases théoriques élargies

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

L'étudiant dispose de connaissances pratiques en :

- géométrie, algèbre linéaire, algorithmes (classification, recherche, hachage) et structures de données (structures linéaires, structures arborescence)
- connaissances de base de la théorie des graphes (structures de données et algorithmes)
- complexité algorithmique, logique, théorie des probabilités

Ces connaissances font partie de tout bon livre d'introduction sur les algorithmes. Par exemple, les chapitres 1-12, 15-17, 22-26, 28-29, 34-35 de Cormen (2009) couvrent parfaitement les pré-requis de ce cours.

Brève description du contenu et des objectifs

Ce module présente différentes catégories d'algorithmes avancés ainsi que leurs domaines d'application typiques.

La première partie du module approfondira les connaissances sur les structures de données qui permettent de gérer efficacement des ensembles de données très grands, complexes ou dynamiques, voire combinant ces trois caractéristiques. À l'issue du module, les étudiants seront capables de sélectionner le meilleur algorithme et de l'appliquer à des tâches telles que l'indexation, la recherche, l'extraction, l'insertion ou la mise à jour de données volumineuses, comme celles que l'on rencontre dans les systèmes d'informations géographiques, les hypertextes ou en intelligence artificielle.

La seconde partie du module présentera des techniques de base pour la conception d'algorithmes appliqués à des problèmes d'optimisation difficiles. La combinaison de ces techniques de base ?modélisation, construction de solution, amélioration de solution, décomposition de problème, apprentissage? conduit à des métaheuristiques classiques comme les algorithmes génétiques, les colonies de fourmi artificielles ou la recherche avec tabous. À l'issue du module, les étudiants seront capables de concevoir et d'appliquer ces techniques à des problèmes d'optimisation difficiles.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Ce module donne une vue d'ensemble diverses classes d'algorithmes fréquemment utilisés en pratique. Sur la base de connaissances solides, l'étudiant est capable de concevoir et d'implanter les algorithmes les plus efficaces et les plus appropriés pour ses propres applications. À l'issue du module, l'étudiant :

- connaît différentes catégories d'algorithmes avancés et leurs domaines d'application ;
- a une bonne connaissance en structures de données avancées et leur utilisation pour gérer efficacement des données volumineuses, complexes et/ou dynamiques ;
- est en mesure d'évaluer quels algorithmes sont appropriés pour réaliser efficacement certaines tâches telles que l'indexation, la recherche, l'extraction, l'insertion ou la mise à jour de données volumineuses ;
- connaît les algorithmes dynamiques utilisés en robotique ou en intelligence artificielle

Contenu des modules avec pondération du contenu des cours

Algorithmes et structures de données pour quelques problèmes spécifiques. Poids 50%

- Rappels sur les structures linéaires, les arbres de recherche binaires, les tas et la complexité algorithmique
- Algorithmes randomisés (tri rapide, sélection en temps linéaire, arbre kD, arbre de requête d'énumération, triangulation de Delaunay)
- Algorithmes déterministes (sélection en temps linéaire, arbre kD)
- Algorithmes de balayage (plus proche paire de points, intersection de segments)
- Algorithmes gloutons (codage de Huffman, Dijkstra, tas de Fibonacci)

Conception d'algorithmes heuristiques. Poids 50%

- Rappels de théorie de la complexité, de modélisation de problèmes, d'optimisation combinatoire
- Algorithmes gloutons
- Heuristiques de recherche locale
- Méthodes de décomposition
- Heuristiques randomisées
- Heuristiques d'apprentissage
- Métaheuristiques classiques: GRASP, colonies de fourmis artificielles, recherche tabou, recuit simulé, méthodes de bruitage, algorithmes génétiques

Méthodes d'enseignement et d'apprentissage

- Enseignement ex-cathedra
- Présentation et discussion d'études de cas
- Apprentissage par résolution de problème
- Exercices théoriques et de programmation

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic knowledge of the calculation of probabilities and statistics: models; parameter estimation; knowledge of how statistical tests are compiled and what confidence intervals are; user knowledge of a statistical program (Excel, R, S-PLUS, SPSS or MATLAB); fundamental laboratory experience (measuring technology)

Brief course description of module objectives and content

Students are introduced to statistical tools used in the industrial sector, and particularly in process and quality control. In this module, students learn to plan and conduct statistical evaluations independently.

Aims, content, methods

Learning objectives and acquired competencies

To be in a position to plan and evaluate experiments in an industrial environment; understand how processes are statistically controlled and improved; be capable of analyzing and interpreting data by means of regression analysis; be able to implement the methods covered with a statistical package.

Contents of module with emphasis on teaching content

Statistical process and quality control (SPC): the "Magnificent Seven", control charts, operating characteristic curve, acceptance sampling (weighting 1/3)

Introduction to multiple regression analysis: model prerequisites, confidence and prediction intervals, graphic checking of model assumptions (weighting 1/3)

Overview of Design of Experiment – DoE (planning and evaluating experiments): basic principles for the planning of experimental studies, one-way and multi-way analysis of variance, factorial experiment designs and their analysis, block designs (weighting 1/3)

The contents listed are illustrated with case studies from the industrial and scientific environment. In doing so, use is made of graphical methods and statistical bases, including classic and robust estimation methods and Monte Carlo simulations.

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Connaissances de base dans le calcul des probabilités et de la statistique: modélisation, paramètres et estimations; connaissances des tests d'hypothèses et des intervalles de confiance; connaissances d'un logiciel de statistique (Excel, R, S-PLUS, SPSS ou MATLAB); connaissances de base du travail en laboratoire (technique de mesure)

Brève description du contenu et des objectifs

Le module présentera aux étudiants les outils statistiques utilisés dans le secteur industriel, en particulier dans la maîtrise statistique des procédés et le contrôle de qualité. Le module apprendra aux étudiants à planifier les expériences et à interpréter avec assurance les résultats obtenus à l'aide de méthodes statistiques.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Savoir planifier et exploiter au maximum les expériences dans le milieu industriel; optimiser les procédés et améliorer leur qualité en minimisant l'effort expérimental; savoir analyser et interpréter les résultats obtenus par régression; appliquer les méthodes présentées au cours en utilisant un logiciel de statistique.

Contenu des modules avec pondération du contenu des cours

Maîtrise statistique des procédés et contrôle de la qualité (MSP): étapes d'un projet, cartes de contrôle (control charts), protocoles industriels, échantillonnage d'acceptation (pondération 1/3)

Introduction à la régression multivariée: conditions d'application du modèle de régression, intervalles de confiance et de prévision, vérification graphique des conditions d'application du modèle (pondération 1/3)

Introduction aux plans d'expériences – DoE (planification et analyse des résultats): principes fondamentaux des plans d'expériences, diagramme d'Ishikawa, analyse de variance univariée ou multivariée, effets principaux et interactions, plans factoriels, interprétation des résultats, plan bloc (pondération)

Les concepts présentés au cours seront illustrés par des cas concrets issus du milieu industriel. Différentes méthodes graphiques et statistiques seront utilisées comme, par exemple, les méthodes d'estimation classiques et robuste et la simulation de Monte-Carlo.

Méthodes d'enseignement et d'apprentissage

Cours magistraux, travaux pratiques sur ordinateur à l'aide d'un logiciel de statistique

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basics of theoretical analysis of algorithms.

Brief course description of module objectives and content

An algorithm is typically called efficient if its worst-case running time is polynomial in the size of the input. This course will focus on a huge and practically relevant family of problems, namely NP-hard ones, for which (most likely) no efficient algorithm exists. This family includes fundamental problems in computational biology, network design, systems, computer vision, data mining, online markets, etc.

The first goal of this course is to learn how to identify NP-hard problems.

For a given NP-hard optimization problem it might still be possible to compute efficiently a feasible solution whose cost is (in the worst-case) within a

small multiplicative factor (approximation factor) from the optimum: this is the aim of approximation algorithms. The second goal of this course is to learn how to design accurate approximation algorithms, and how to (theoretically) bound their approximation factor.

Aims, content, methods

Learning objectives and acquired competencies

The main goal of this course is to learn how to identify NP-hard problems, and how to design and (theoretically) analyze approximation algorithms for fundamental NP-hard optimization problems.

Contents of module with emphasis on teaching content

A. Complexity Classes: polynomial Reductions; NP-completeness and NP-hardness.

B. NP-hard problems: SAT and Max-SAT; Vertex/Set Cover; Steiner Tree and generalizations; TSP; Max Cut; Knapsack and Bin Packing; k-Center and clustering; Scheduling; Facility Location; Item Pricing; etc.

C. Approximation Algorithms:

1. Basic notions: approximation factor; hardness of approximation.
2. Basic techniques: greedy; local search; randomization; dynamic programming.

LP-based techniques: randomized rounding; primal-dual; iterative rounding.

Teaching and learning methods

Interactive lectures both for theory and exercises.

Brief course description of module objectives and content

Medical engineering is the intersection of many different disciplines. From engineering in its most varied forms, mechanics, electronics, computer science, management, to disciplines related to medicine: biology, anatomy, and physiology. In order to understand and put into practice the notions that the student will learn in this fascinating path, the same can not ignore the acquisition of basic knowledge about the human body. Thanks to this module the student will learn the basics of life as we know it, as well as the structure and functioning of the major systems present in the human body.

Aims, content, methods

Learning objectives and acquired competencies

The student is faced with the most important aspect of human biology, anatomy, and physiology. She/he learns the basics of:

- mammalian cell biology
- the most important physiological systems
- the anatomy systems
- human pathology

Contents of module with emphasis on teaching content

Basics of mammalian cell biology including stem cell biology and cell cultivation techniques.

Basics of anatomy; skeleton, locomotory system, cardio-vascular system, respiratory system, nervous system (CNS & PNS) and the sensory system (eye, ear, olfactory system, vestibular system, proprioception, and touch)

Basics of physiology: introduction of the physiology of the nervous system (CNS and PNS), the cardio-vascular system, the locomotory apparatus as well as the hormone system

Module Category

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Linear Algebra

- Algebra with vectors and matrices
- Elementary solving linear systems of equations (Gauss Pivoting)
- Eigenvectors and Eigenvalues

Analysis

- Univariate and multivariate calculus (differentials, integrals)
- Knowing of simple numerical recipes for equations and integrals (e.g. Bi-Section, Newton, Trapezoidal-Rule, Simpson-Rule...)
- Ordinary differential equations including simple numerical recipes (e.g. Euler)

Basics in Computer Handling

- Operating system, software installation
- Elementary skills in procedural programming

Hardware and Software

- Notebook
- Mathematical software installed (e.g. Mathematica, Matlab, Maple ... according to preference and experience)

Brief course description of module objectives and content

After successful studying students are capable to solve selected practical mathematical problems by combining appropriate numerical methods with suitable computer algebra tools. Moreover, students know how to interpret and visualize computational outcomes resulting from numerical algorithms.

Aims, content, methods

Learning objectives and acquired competencies

Solving mathematical problems with practical relevance by

- capable handling a computer algebra system (CAS) or appropriate mathematical software
- mastering selected numerical methods

Knowing limits of computer based methods and comprehension of

- some internals of CAS (e.g. representations of numbers and functions)
- the problems of numerical stability, errors from rounding and discretization
- algorithmic complexity (e.g. convergence speed)

Combining analytical methods of CAS with efficient numerical software

Interpreting and visualizing computational results

Contents of module with emphasis on teaching content

Processing

- data from problems with practical relevance
- by tools from numerical mathematics and analytics
- up to interpretation and visualization of results

Based on a selection of methods listed below

- Solving systems of linear equations (LU-Decomposition, Cholesky Decomposition, Householder Transformations, QR Decomposition, sparse matrix strategies and Gauss-Seidel ...)
- Computations of zeroes and non-linear optimization
- Univariate and multivariate interpolation and approximation (Collocation, Osculation, Splining, Least-Squares Approximation, Chebyshev Approximation ...)
- Numerical differentiation and integration
- Initial and boundary value problems of ordinary differential equations

With consideration of

- Accuracy, efficiency and condition
- Problem identification and method selection
- Computeralgebra in order to establish analytical relations

Teaching and learning methods

- Derivation of mathematical facts in lectures
- Software demonstrations and visualizations by the lecturer during the lectures
- Teaching based on problems with practical relevance
- Software examples and additional materials on complimentary website ([Zuerich](#))
- Hints to sources and literature on complimentary website ([Zuerich](#))
- Self-studies based on sources and literature
- Doing homework as a preparation for dedicated exercise lessons

Literature

Catégorie de module

FTP bases théoriques élargies

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Algèbre linéaire:

- calcul vectoriel et matriciel
- procédures élémentaires de résolution pour les systèmes d'équation linéaires (méthode du pivot de Gauss)
- valeur propre et vecteur propre

Analyse

- Equation différentielle et intégrale à une ou plusieurs variables
- Connaissance des procédés numériques simples (règle du trapèze, de Simpson, méthode du carré, de la bisection, règle de Newton ...)
- équations différentielles générales, simples procédés numériques inclus

Bases en utilisation d'ordinateurs

- systèmes d'exploitation, installation de logiciels incluse
- rudiments de la programmation procédurale

Matériel et logiciel

- Possession d'un ordinateur portable
- Mathematica (version étudiant) installé

Elaboration d'un petit « cours d'introduction »: premiers pas avec Mathematica, dans le cadre de l'apprentissage autodidacte, avec le début des cours magistraux

Brève description du contenu et des objectifs

Les étudiants sont en mesure, après réussite de ce module, de résoudre des problèmes mathématiques sélectionnés dans la pratique via une combinaison de logiciels de calcul formel, à l'aide de méthodes sélectionnées dans le calcul numérique, ainsi que d'en interpréter les résultats et de les présenter grâce à la visualisation.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Résolution de problèmes mathématiques issus de la pratique grâce à

- une manipulation compétente d'un logiciel de calcul formel (CAS)
- la maîtrise de méthodes sélectionnées dans le calcul numérique

Connaissance des limites des méthodes assistées par ordinateur en comprenant

- le fonctionnement interne des CAS (par exemple présentation de chiffres et de fonctions ...)
- la stabilité numérique (erreurs d'arrondissement et de discrétisation) et la complexité algorithmique (vitesse de convergence)

Association de méthodes symboliques d'un CAS à l'efficacité de logiciels numériques

Interprétation et présentation des résultats (de calcul) grâce à la visualisation

Contenu des modules avec pondération du contenu des cours

Traitement

- des données complexes issues de problèmes d'importance pratique
- via des outils de calcul numérique et de calcul symbolique
- de l'interprétation et de la visualisation des résultats

A l'aide de méthodes tirées de la liste suivante:

- Résolution de systèmes d'équation (factorisation LU, factorisation de Cholesky, transformation de Householder et factorisation QR, stratégies de matrices creuses et méthodes de Gauss-Seidel ...)
- Détermination des zéros et optimisation non linéaire
- Interpolation uni-et multidimensionnelle et approximation (Interpolation, splines, ajustement de courbe, approximation de Chebyshev ...)
- Dérivée et intégrale numérique
- Conditions initiales et conditions aux limites des équations différentielles ordinaires

En tenant compte de

- la précision, l'efficacité et la condition
- l'identification des problèmes et la sélection des méthodes
- le calcul formel pour la déduction de rapports complexes

Méthodes d'enseignement et d'apprentissage

- Communication d'information pure à travers le cours magistral
- Démonstration logicielle par le professeur dans le cadre du cours magistral
- Enseignement porté sur les problèmes au moyen d'exemples d'importance pratique
- Exemple de code pour site Web à compléter
- Référence à la littérature pour site Web à compléter
- Etude autodidacte assistée par les ouvrages de référence
- Traitement des tâches appropriées au cours de l'apprentissage autodidacte pour la préparation aux heures d'exercices

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

No particular prerequisites are required, but fundamental interest in practical applications of mathematics!

Brief course description of module objectives and content

This course provides the mathematical fundamentals of cryptography and coding theory and illustrates them with numerous practical examples.

Aims, content, methods

Learning objectives and acquired competencies

This course provides advanced methods of applied algebra and number theory and concentrates on their practical applications in cryptography and coding theory.

Contents of module with emphasis on teaching content

- Algebra: algebraic structures (groups, fields), modular arithmetic, Chinese remainder theorem, construction and fundamental properties of finite fields (Galois fields $GF(p^m)$), applications to cryptography and coding theory
- Algorithms in number theory (primality tests, integer factorization methods, elliptic curves), applications to cryptography and coding theory
- Use of a development environment (Java, C, C++)

Week	Contents (Order and weighting may be adapted)
1	Algebraic basics:
2	modular arithmetic, Euclidean algorithm, extended Euclidean algorithm, Bezout theorem, Fermat Euler theorem, Chinese Remainder theorem
3	Asymmetric (public key) cryptography:
4	Diffie Hellman key exchange, RSA algorithm, digital signatures
5	Algebraic basics: polynomials and finite fields
6	Symmetric (secret key) cryptography: review of important examples (substitution cipher, transposition cipher, product cipher, block cipher, etc.)
7	Symmetric (secret key) cryptography: Hash functions, Data Encryption Standard (DES), Advanced Encryption Standard (AES), modes of operation, authenticated encryption
8	Elliptic Curve Diffie Hellman (ECDH), digital signatures
9	
10	One-time pad (OTP), Quantum Cryptography
11	Error-correcting codes:
12	Cyclic codes, Reed-Solomon, BCH, Convolutional Codes, Turbo Codes
13	
14	

Teaching and learning methods

- Lectures with practical application examples
- Exercises with solutions allowing knowledge application and deepening

Brief course description of module objectives and content

The goal of this module is to teach the fundamentals of image processing, while putting emphasis on their mathematical and algorithmic principles. In addition, specific 2D and 3D industrial and biomedical applications will be treated.

Aims, content, methods

Learning objectives and acquired competencies

Upon completion of this lecture, the students should be able to formulate an image processing problem and to propose and pursue alternative ways to its solution. They can discuss and compare different algorithms and their implementations with regard to robustness, speed and complexity.

Contents of module with emphasis on teaching content

1. Digital Image Fundamentals

- Linear and nonlinear systems
- Coordinate systems
- Geometric transformations
- Statistics: mean, standard deviation, histograms

2. From 2D to 3D

- Camera model
- Epipolar geometry

3. Linear and nonlinear filtering

- Convolution
- Correlation
- Spatial and frequency domain filtering

4. Morphological Image Processing

- Erosion & Dilatation, Opening and Closing
- Hit-or-Miss-Transformation (HMT)
- Connected Filtering

5. Image Segmentation

- Edge based
- Region based
- Intensity based

6. Image description

- Boundary descriptors
- Regional descriptors
- Texture descriptors
- Salient points

7. Object Recognition

- Model based
- Bayesian classifier
- Modern methods

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Mathématiques : Bases d'analyse et d'algèbre linéaire, notions de probabilités, dérivées, produit matriciel et vectoriel, bases orthogonales, valeurs propres et vecteurs propres

Programmation : Bonne maîtrise d'au moins un langage structuré (p.ex., Python, Matlab, R, Java, C, C++)

Statistiques : moyenne, écart-type, variance, co-variance, histogrammes, distribution normale (gaussienne)

Traitement de signal : systèmes linéaires et invariants, convolution, filtrage 1D, échantillonnage, transformée de Fourier

Brève description du contenu et des objectifs

Le but de ce module est de décrire avec une assise mathématique et algorithmique, les bases du traitement de l'image. Certaines applications 2D et 3D, industrielles et biomédicales seront décrites.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Après ce cours, l'étudiant est capable de mettre en oeuvre une ou plusieurs solutions pour résoudre une tâche de traitement d'image. Les alternatives doivent être discutées en termes de robustesse, de vitesse et de complexité.

Contenu des modules avec pondération du contenu des cours

1. Principes de base du traitement d'image

- Systèmes linéaires & non-linéaires,
- Systèmes de coordonnées,
- Transformations géométriques
- Statistique (moyenne, déviation standard, histogramme)

2. De 2D à 3D

- Modèle de la caméra
- Géométrie épipolaire

3. Filtrage linéaire et non linéaire

- Convolution
- Corrélation
- Filtrage spatial et fréquentiel

4. Traitement d'image morphologique

- Erosion & Dilatation, Ouverture et Fermeture
- Hit-or-Miss-Transformation (HMT)
- Filtrage connexe

5. Segmentation

- Basée sur les contours
- Basée sur les régions
- Basée sur l'intensité

6. Descripteurs d'image

- Contours
- Régions
- Texture
- Points saillants

7. Détection d'objets et classification

- Basée sur un modèle
- Classificateur bayésien
- Méthodes modernes

Méthodes d'enseignement et d'apprentissage

Module Category

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

This course should sensitize students to the questions of sustainable energy employment and is directed towards a wide public. Knowledge of the fundamentals of thermodynamics and energy engineering is advantageous but not mandatory. Generally, the course will be taught in English in ZH and in French in LS.

Brief course description of module objectives and content

Energy is one of the major topics of the future. Even in Switzerland, energy consumption is constantly rising, and politically, it has become an accepted fact that we must find ways to reduce energy consumption on a long-term basis. The 2000-watt society envisages reducing the current output of 6 kW utilized by each citizen to 2 kW by the end of the century.

It is possible to end the existing dependence of a country's Gross National Product on energy consumption. There are numerous ways to lower

energy consumption without losing wealth. Often, these solutions are not implemented by decision makers in the political, economic and technological sectors because of a lack of knowledge of the physical connections in energy engineering. The law of supply and demand, which can lever new forms of energy, will only become effective when substantial price increases result from the serious bottlenecks in the power supply. The early discussion and implementation of solutions for the future energy supply is currently providing Switzerland with a long-term substantial economic advantage in international competition.

The objective of this course is threefold: We will begin by dealing with the subject of the energy problem using Switzerland as an example. Afterwards, we will develop feasible solutions, such as using energy rationally, recovering heat, or applying heat pumps for the use of energy potential at a lower temperature. In addition, we will discuss how to implement measures within the private sector, at an industrial site, or in a municipality.

In the course Energy: Production, Consumption and Management, we will address the necessary theoretical basic principles of energy technology. Using concrete examples, the functionality of various procedures of energy transformation and of systems with which energy can be used intelligently and efficiently will be conveyed.

This course is aimed particularly at students who have an interest in energy technology and related fields and have recognized the need to seek applicable solutions. The course provides the necessary basic principles for the multifaceted aspects of the topic.

Aims, content, methods

Learning objectives and acquired competencies

- To become acquainted with short, medium and long-term energy sources which are available nationally and/or world-wide; to gain an understanding of the technical connections of efficient employment of energy in the future (2000-watt society, the carbon dioxide problem);
- Ability to understand and communicate with specialists from the various sectors such as energy management, energy production, and energy consumption;
- Ability to make a sensible choice between different technical systems that satisfy the requirements and the available energy sources, and to do this without disregarding economic, ecological and social aspects. This involves:
 - the knowledge of the economical potential of energy systems,
 - the knowledge of methods of rational energy use, and
 - the ability to quantify energy conservation with thermodynamics methods.

Contents of module with emphasis on teaching content

This module addresses the following aspects:

- Available forms of energy (renewable or non-renewable)
- The demand for these forms of energy and their stocks
- The value of the various forms of energy ('Noblesse')
- Small and large-scale power plants
- The potential of recycling energy
- Energy management in industry and in buildings
- The economical advantages of rational energy use
- Mobility
- LCA
- Sustainability

Teaching and learning methods

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Ce cours de sensibilisation à l'énergétique s'adresse à un très large public. Des connaissances de base de thermodynamique sont un avantage mais ne sont pas indispensables.

La connaissance de l'anglais, de la part de l'étudiant, se résume à la compréhension. Aucun critère lié à la maîtrise de la langue ne sera pris en compte.

Brève description du contenu et des objectifs

L'énergie est une grande préoccupation d'aujourd'hui et le problème de la disponibilité de la ressource et de son utilisation optimale va encore s'amplifier demain. Alors que la consommation énergétique ne cesse de croître en Suisse, une volonté politique tend à vouloir réduire notre consommation (actuelle de 6 kW) à 2 kW, d'ici la fin du 21e siècle.

Bien qu'il existe une relation entre le PIB d'un pays et sa consommation d'énergie, une multitude de solutions existent pour limiter la consommation. Elles sont cependant rarement appliquées par méconnaissance du domaine, sur les plans politique, social, économique et technique. Basée sur la loi de l'offre et de la demande, la pénurie ne se fera sentir que lentement, à coup d'augmentations plus ou moins brutales. Il est donc nécessaire d'aborder maintenant les solutions de l'avenir afin d'anticiper les besoins du marché et de pouvoir en retirer les avantages.

L'approche de ce cours est de poser d'abord la problématique au niveau du pays et présenter des éléments de solutions applicables, tant pour les ressources, l'utilisation rationnelle ou encore la valorisation de rejets industriels. Puis la mise en application au niveau d'un site industriel, d'une communauté ou dans le domaine privé, est abordée.

Partant de constats et des mesures globales, le cours est guidé par des considérations théoriques tout en s'appuyant sur des exemples concrets, permettant de comprendre comment traiter intelligemment l'énergie.

Ce cours est spécialement conçu pour tout bachelier éprouvant le besoin ou l'intérêt de comprendre les enjeux énergétiques et de choisir les solutions appropriées au contexte. Il donne ainsi les bases indispensables aux multiples aspects des métiers de l'énergie.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Connaître à court, moyen et long terme les ressources énergétiques disponibles dans un contexte national et/ou international et comprendre les enjeux énergétiques de demain. (société à 2 kW, CO2)
- Savoir communiquer avec les spécialistes des divers domaines de la gestion, production et utilisation de l'énergie.
- Orienter judicieusement les choix techniques en fonction des besoins et des ressources, en tenant compte des aspects économiques, écologiques et sociaux.
 - Identifier les potentiels d'économies d'énergie
 - Trouver les solutions rationnelles liées à la consommation
 - Quantifier les gains avec des méthodes rigoureuses (thermodynamique)

Contenu des modules avec pondération du contenu des cours

Ce module traite les différents aspects suivants :

- Les ressources énergétiques existantes (renouvelables ou non)
- Les besoins et les réserves de ces différentes formes d'énergie
- La valeur des différentes formes d'énergie (noblesse)
- Les petites et grandes pertes d'énergie
- Les potentiels de revalorisation de l'énergie
- La gestion de l'énergie dans l'industrie et les bâtiments
- Les avantages économiques d'une utilisation rationnelle de l'énergie.
- La mobilité
- LCA
- Systèmes durables

Méthodes d'enseignement et d'apprentissage

Cours frontal, exposés, séminaires, étude de cas

Verständnis der Lehrinhalte aus den in BSc Studiengängen vermittelten Rechtsgebieten (ZGB / OR)

Kurzbeschreibung der Inhalte und Ziele

Im Modul werden ArchitektInnen, BauingenieurInnen, GeomatikingenieurInnen, RaumplanerInnen, Umweltingenieurinnen und weitere mit Projekten mit öffentlichen Aufgaben konfrontierte Personen die rechtlichen Grundsätze, gesetzlichen Regeln und Ausführungsbestimmungen vermittelt. Sie sollen befähigt werden, ihr Projekt (Neubau, Umbau, Rückbau, Erweiterung, Entwicklungen und Gestaltungen des Lebensraumes, usw.) rechtskonform und verfahrensrechtlich richtig zu realisieren und mit rechtlichen Friktionen umzugehen.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Die Studierenden kennen und verstehen die wichtigsten raum-, bau- und umweltrelevanten Gesetzesbestimmungen und deren Ziele im Hinblick auf die Erreichung einer nachhaltigen Weiterentwicklung des Lebensraums.

Die Studierenden können die sich daraus ergebenden Konsequenzen ableiten und in konkreten Einzelfällen einer Lösung zuführen.

Die Studierenden sind in der Lage, komplexe Probleme in der öffentlichen Rechtsprechung zu erfassen und relevante verwaltungs- und verfahrensrechtliche Abläufe einzuordnen.

Modulinhalt mit Gewichtung der Lehrinhalte

Die Inhalte des Moduls werden in den folgenden thematischen Blöcken vermittelt:

Raumplanungsrecht

- System und Grundsätze der Raumplanung
- Bundesplanung und kantonale Richtplanung
- Nutzungsplanung und Nutzungsplan
- Sondernutzungsplan, Landumlegung, Sicherung der Ausgangslage für künftige Planungen (Planungszonen)
- Umsetzung der Rechts- und Planungsvorgaben (insbes. Förderung der Verfügbarkeit von Bauland, Mehrwertausgleich)

Öffentliches und privates Baurecht

- Baubewilligung / Zonenkonformität und Erschliessung
- Bauvorschriften und Ausnahmbewilligung
- Baurechtliche Verfahren, Baukontrolle und Sanktionen im Baurecht
- Privates Baurecht: Eigentum, Nachbarrecht, Grundbuchrecht (ZGB)
- Privates Baurecht: Bauvertragsrecht (Planerverträge, Bauwerkvertrag, Auftrag, SIA-Norm 118)

Umweltrecht

- Grundsätze des Umweltrechts
- Immissionsschutz, Gewässerschutz, Natur- und Heimatschutz und Walderhaltung
- Die Umweltverträglichkeitsprüfung - Rechtsschutz und Verfahren

Lehr- und Lernmethoden

- Vorlesung/Kolloquium
- Projektbezogenes Lernen
- Betreute Übungen mit Fallstudien
- Selbststudium

Connaissances préalables, compétences initiales

Compréhension des contenus juridiques traités dans les filières BSc (Code Civil / Code des Obligations)

Brève description du contenu et des objectifs

Ce module destiné à des architectes, ingénieur-e-s en génie civil, géomaticien-ne-s, urbanistes, ingénieur-e-s en environnement et autres chargé-e-s de missions publiques et donne un aperçu des grands principes juridiques ainsi que des lois et ordonnances applicables. Le public visé doit être en mesure de réaliser son projet (construction neuve, rénovation, démolition, agrandissement, développement et aménagement du territoire, etc.) en conformité avec les réglementations et pouvoir gérer les problèmes juridiques associés.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiant-e-s connaissent et sont capables de comprendre les principales dispositions légales relatives à l'aménagement du territoire et au droit de la construction ainsi que leurs objectifs en termes de développement durable des zones habitables.

Les étudiants sont à même d'en déduire les conséquences qui en résultent et de proposer une solution sur des études de cas concrets.

Les étudiants sont en mesure de situer des problèmes complexes par rapport aux règles de droit communément admises, et d'en déduire les procédures administratives et juridiques pertinentes.

Contenu des modules avec pondération du contenu des cours

Le contenu du module est structuré en trois blocs thématiques :

Droit de l'aménagement du territoire

- Système et principes d'aménagement du territoire
- Plan directeur fédéral et plans directeurs cantonaux
- Plans d'affectations
- Plans d'affectations spécifiques, remembrement, sécurisation de la situation initiale pour la planification future (zones d'affectation)
- Mise en œuvre des exigences légales et de planification (en particulier promotion et disponibilité des terrains constructibles, dédommagement pour l'aménagement du territoire)

Droit public et privé de la construction

- Permis de construire / conformité à l'affectation des zones et aménagement du territoire
- Règlements d'urbanisme et permis dérogatoire
- Procédure en droit de la construction, contrôle de la construction et sanctions prévues par le droit de la construction
- Droit civil et droit pénal en construction, propriété, rapport de voisinage, registre foncier (CC)
- Contrats de construction (contrat pour prestations de mandataire, contrat d'entreprise dans la construction, mandat simple, Norme SIA 118)

Droit de l'environnement

- Principes du droit de l'environnement
- Protection contre les émissions, protection des eaux, des forêts, de la biodiversité et du paysage.
- Étude d'impact sur l'environnement, procédure et voies de droit

Méthodes d'enseignement et d'apprentissage

- Enseignement frontal/ Colloque
- Apprentissage axé sur des projets
- Travaux dirigés avec études de cas
- Etude autonome

Basic knowledge in mathematics (introductory lecture in analysis and linear algebra)

MS Excel (implementation of formulae, graphs)

Brief course description of module objectives and content

In this module, students are introduced into basic concepts of lifecycle management of infrastructures with respect to costs vs benefit. Established cost and benefit models of infrastructures are discussed. Based on lifecycle costs analysis, we introduce different methods for the assessment of maintenance strategies, and for decision making with respect to construction, preservation, and replacement. The cost-based approaches are complemented with methods for the analysis of reliability, availability, and risk.

Aims, content, methods

Learning objectives and acquired competencies

- the students understand the function and the benefit of infrastructures, and their effect on society, economy, and environment
- the students are familiar with the challenges for sustainable development of infrastructures
- the students are familiar with concepts to derive requirements for infrastructures, their verification and validation.
- the students are familiar with the most important methods for decision making in infrastructure management, and are able to apply those methods in concrete cases; for example the calculation of life cycle costs or socio-economic impact, or the simultaneous minimization of costs and risks at maximum benefit.
- the students are familiar with the different maintenance strategies (reactive, preventive, condition-based)
- the students know different models of failure and wear behavior, and can apply them
- students know the concepts of reliability theory
- the students know the methods of risk analysis and risk management and can apply them
- the students are familiar with the method of risk-based maintenance, and can apply this method for maintenance management

Contents of module with emphasis on teaching content

- basic concepts
 - introduction into the infrastructure networks of electricity, water, road, and rail
 - social, political and economic dimension and relevance of infrastructures
 - concepts of cost and benefit assessment
 - standards for life cycle management
- infrastructure costs
 - life cycle costing
 - concepts, methods, and instruments for the analysis of economic performance
 - state and state dynamics
 - monetary models of benefit and their limits
 - maintenance strategies and replacement
- assessment methods
 - cost-benefit analyses
 - utility analysis
- processes and activities during the lifecycle
 - requirements for infrastructure assets
 - failure and degradation behavior of systems and components, and modeling
 - methods and models for reliability and maintenance
 - condition-based and preventive maintenance, optimum maintenance cycles
- risk analysis and risk management of infrastructure
 - what is risk?
 - risk analysis, risk mitigation, and risk acceptance
 - risk management
 - risk-based maintenance

Teaching and learning methods

Lecture: Introduction in the relevant concepts with examples

Exercises: applications and use cases

Literature

Supplementary publications.

Examination		X F 100%	X E 100%	X E 100%

Module Category

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

- **Math:** basic calculus / linear algebra / probability calculus (e.g., derivatives, matrix multiplication, normal distribution)
- **Statistics:** basic descriptive statistics (e.g., mean, variance, co-variance, histograms, box plots)
- **Programming:** good command of any structured programming language (e.g., Python, Matlab, R, Java, C, C++)
- **Analytics:** basic data analysis methods (data pre-processing, linear & logistic regression)

Brief course description of module objectives and content

Machine learning (ML) emerged out of artificial intelligence and computer science as the academic discipline concerned with “giving computers the ability to learn without being explicitly programmed” (A. Samuel, 1959). Today, it is the methodological driver behind the mega-trend of digitalization. ML experts are highly sought after in industry and academia alike.

This course builds upon basic knowledge in math, programming and analytics/statistics as is typically gained in respective undergraduate courses of diverse engineering disciplines. From there, it teaches the foundations of modern machine learning techniques in a way that focuses on practical applicability to real-world problems. The complete process of building a learning system is considered:

- formulating the task at hand as a learning problem;
- extracting useful features from the available data;
- choosing and parameterizing a suitable learning algorithm.

Covered topics include cross-cutting concerns like ML system design and debugging (how to get intuition into learned models and results) as well as feature engineering; covered algorithms include (amongst others) Support Vector Machines (SVM) and ensemble methods.

Aims, content, methods

Learning objectives and acquired competencies

- Students **know** the **background and taxonomy** of machine learning methods
- On this basis, they **formulate** given problems as **learning tasks** and **select a proper learning method**
- Students **are able to convert** a data set into a proper **feature set** fitting for a task at hand
- They **evaluate** the chosen **approach** in a structured way using proper design of experiment
- Students **know how** to select models, and „**debug**“ features and learning algorithms if results do not fit expectations
- Students are able to leverage on the evaluation framework to **tune the parameters** of a given system and **optimize** its performances
- Students **have seen examples of different data** sources / problem types and **are able to acquire additional expert knowledge** from the scientific literature

Contents of module with emphasis on teaching content

- **Introduction** (2 weeks): Convergence for participants with different backgrounds
- **Supervised learning** (7 weeks): Learn from labeled data
Cross-cutting topics: Feature engineering; ensemble learning; debugging ML systems
Algorithms: e.g. SVM, ensemble learning, graphical models (Bayesian networks)
- **Unsupervised learning** (3 weeks): Learning without labels
Algorithms: e.g., dimensionality reduction, anomaly detection, archetypal analysis
- **Special chapters** (2 weeks):
Algorithms: e.g., reinforcement learning, recommender systems, hidden Markov / Gaussian mixture models

FTP bases théoriques élargies

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- **Mathématiques:** calcul de base / algèbre linéaire / calcul des probabilités (c.-à-d. dérivées, multiplication de matrices, distribution normale)
- **Statistiques:** statistiques descriptives de base (c.-à-d. moyennes, variances et covariances, histogrammes, boîtes à moustaches)
- **Programmation:** bonne maîtrise d'un langage de programmation structuré (c.-à-d. Python, Matlab, R, Java, C, C++)
- **Analyse:** méthodes d'analyse des données élémentaires (prétraitement des données, régression linéaire & logistique)

Brève description du contenu et des objectifs

L'apprentissage automatique ou Machine Learning (ML) est le fruit de l'intelligence artificielle et de la science informatique, et se définit comme une discipline universitaire visant à « donner aux ordinateurs la faculté d'apprendre sans avoir été explicitement programmés pour le faire ». (A. Samuel, 1959). A l'heure actuelle, l'apprentissage automatique est le moteur méthodologique des grandes tendances de fond de la digitalisation. Les experts en ML sont très recherchés aussi bien dans le milieu universitaire que dans le monde industriel.

Ce cours s'appuie sur des connaissances de base en mathématiques, programmation et analyses/statistiques telles qu'elles sont dispensées dans les différents cursus bachelor d'ingénieurs. Partant de là, il enseigne les bases des techniques modernes de l'apprentissage automatique par une méthode centrée sur la mise en pratique et l'application à des problèmes de la vie réelle. Le processus de création d'un système d'apprentissage est abordé dans sa globalité:

- formulation de la tâche à l'étude sous forme de problème d'apprentissage ;
- extraction de caractéristiques intéressantes à partir des données disponibles ;
- sélection et paramétrage d'un algorithme d'apprentissage convenant à la situation.

Les sujets abordés englobent des concepts transversaux tels que la conception et le débogage de système ML (comment interpréter les modèles appris et leurs résultats) ainsi que l'ingénierie des caractéristiques (feature engineering) ; les algorithmes abordés comprennent (parmi d'autres) les machines à vecteurs de support (Support Vector Machines) ainsi que les méthodes d'apprentissage ensemblistes.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Les étudiants **connaissent le contexte et la taxonomie** des méthodes d'apprentissage automatique ;
- Sur cette base, ils **traduisent** des problèmes donnés **en tâches d'apprentissage et sélectionnent une méthode d'apprentissage adaptée** ;
- Les étudiants **sont capables de convertir** un set de données en un **set de caractéristiques** adapté à la tâche à l'étude ;
- Ils **évaluent l'approche choisie** de façon structurée en faisant appel à un design d'expérience adapté ;
- Les étudiants **savent comment** sélectionner des modèles, et «**déboguer**» des caractéristiques et des algorithmes d'apprentissage si les résultats ne répondent pas aux attentes ;
- Les étudiants sont capables d'utiliser les résultats d'évaluation pour **optimiser les paramètres** d'un système donné et **maximiser** ses performances ;
- Les étudiants **ont pris connaissance d'exemples de différentes sources de données** / types de problèmes et sont **capables de consulter la littérature scientifique pour acquérir des connaissances** spécialisées **additionnelles**.

Contenu des modules avec pondération du contenu des cours

- **Introduction** (2 semaines): convergence des participants ayant suivi diverses formations
- **Apprentissage supervisé** (7 semaines) : méthodes de modélisation à partir de données labellisées
Sujets transversaux: feature engineering ; ensemble Learning ; débogage des systèmes ML
Algorithmes: p. ex., SVM, apprentissage ensembliste, modèles graphiques (réseaux bayésiens)
- **Apprentissage non supervisé** (3 semaines) : méthodes de modélisation à partir de données non-labellisées
Algorithmes: p.ex., réduction de dimensionnalité, détection d'anomalie, analyse de prototypes
- **Chapitres spéciaux** (2 semaines):
Algorithmes: p.ex., apprentissage par renforcement, systèmes de recommandation, modèles de mélange gaussien

Méthodes d'enseignement et d'apprentissage

Cours en classe; exercices de programmation (p.ex., Python 3)

Entry level competences**Prerequisites, previous knowledge**

Basic knowledge of

- Calculus (differential and difference equations)
- Linear Algebra (vectors, matrices, change of basis, matrix inversion, computation of eigenvalues)

Brief course description of module objectives and content

Modelling, simulation and optimization are fundamental to solving problems in a number of fields of science, technology and life. Students will learn to design, implement, simulate, and optimize a model of dynamic system. Simulation, the exploration of the dynamic behavior of the model in time and space, is discussed for both continuous and discrete-event systems. Simulating a model allows the evaluation of indicators of the performance of the modelled system, improving our understanding of its behavior and dynamic complexity.

Aims, content, methods

Learning objectives and acquired competencies

The main aim of the course is to understand the pervasive feedback principles that rule the world we live in. Thanks to the acquired competencies, the successful student is expected to be able to tackle problems where temporal dynamics plays a major role. The student will learn about alternative and complementary modelling paradigms: from difference and differential equations for continuous time modelling to queuing systems and discrete event systems for discrete event modelling. The student will be then able to formalise the problem thanks to a dynamical model formulation, implement a simulation of the model, and explore the space of alternative behaviours of the system in order to synthesise a possibly optimal management and control strategy.

Contents of module with emphasis on teaching content

- Tools for systems thinking: introduction to modelling with causal loop diagrams and stock and flows diagrams
- Models of feedback dynamics in dynamic systems: growth and collapse, delays and oscillations
- Elements of systems theory from linear and regular systems to non linear systems: analysis of equilibrium and stability
- Optimisation and control of continuous state and time systems: concept of feedback control, state estimation with the Kalman filter and Optimal Control
- Modelling with discrete event systems: elements of queuing systems.
- Building discrete event systems: modelling input data and analysing output of simulations
- Simulation as an optimisation design tool: design of experiments, metamodelling and the response surface methodology

Teaching and learning methods

Frontal lectures (3h/week) during which the students also perform hands-on exercises with modelling and simulation tools in order to acquire the key applications of the presented theory.

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Basic knowledge of probability, algebra, calculus and differential equations. Basics of procedural programming and ability to implement small programs in an arbitrary language, e.g. Python, Matlab, R, Java, C#, C++, C, etc.

Brief course description of module objectives and content

Natural, social, and engineered complex systems can be modelled as being composed of agents interacting with one another and their environment. This course introduces students to the theory, tools and techniques for understanding and solving problems related to such systems.

The course is composed of two parts. In the first one, both cooperative and selfish agents and interactions between them will be discussed. The methodological support will be provided by game theory.

In the second part, the focus will be on the study and analysis of models of systems in the aim of understanding the conditions under which certain properties can emerge. Based on this, mechanisms to impede possible undesired behaviour of systems and to stir the desired dynamics will be developed.

Throughout the course, several application areas such as cooperation and competition, social networks, opinion dynamics and social influence will be discussed.

Aims, content, methods

Learning objectives and acquired competencies

A successful participant of this course is able to

- understand the rationale of multi-agent systems, modelling and simulation.
- model scenarios with multiple interacting agents in the language of game theory
- evaluate the feasibility of achieving goals with agents using game theory
- learn to choose the appropriate class of models with agents to characterise different complex systems
- implement in an efficient way a model of a system, then visualise, understand and analyse the corresponding outputs

Contents of module with emphasis on teaching content

- Multi-agent interaction: games in normal form, dominant strategies, Nash equilibria, Pareto optimality, partial observability, Bayesian games, cooperative and coalition games, repeated games, multi-agent learning.
- Population dynamics: evolutionarily stable strategies, Replicator's dynamics
- Network dynamics: Small world phenomenon, epidemics
- Multi-agent simulation: Cellular automata and the Game of life, demographic games, opinion dynamics and social influence.

Teaching and learning methods

- Lectures
- Exercises and homework
- Practical work with appropriate tools and group project
- Literature studies

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Bachelor level in physics and mathematics (Newtonian mechanics, ordinary differential equations, elementary knowledge in vector and matrix calculation).
- Elementary knowledge of MatLab or similar software packages

Brief course description of module objectives and content

The module gives students insight into the modeling and simulation of coupled effects (multiphysics). The module provides an overview on the different application fields of multiphysics modeling and simulation in industry. Students learn the methodical procedures that are necessary for successfully solving modeling and simulation problems in the different areas of engineering and physics. The consolidation and deepening of the

theoretical knowledge is achieved on the basis of specific problems that are solved with the appropriate methods and programs (MATLAB, Comsol Multiphysics).

Aims, content, methods

Learning objectives and acquired competencies

Students are in a position to model and simulate local and spatially distributed systems of the type that are encountered in the engineering sciences.

Students are in a position to describe a real problem in physical and mathematical terms. They are able to recognize symmetries and to benefit from them. They are aware of which simplifications can be made and what influence they have on the results. The students know different numerical solution methods and the available equation solvers and finite element packages for solving coupled partial differential equations.

Students learn how to develop reliable models, to validate these and to designate their validity limits.

Students are in a position to critically interpret simulation results.

Contents of module with emphasis on teaching content

- Modeling uncoupled physical phenomena through the application of conservation equations and material laws: transport of mass, energy, charge, momentum. Structural mechanics and flow mechanics are similarly covered in the course.
- Introduction to electromagnetic field modelling (Maxwell's equations).
- Numerical discretization methods for solving partial differential equations: finite differences, finite elements, finite volumes and time discretization.
- Analysis of a multiphysics problem which is formulated analytically and can be solved with paper and pencil, e.g. coupling charge and energy transport in a single dimension.
- Introduction to the modeling of multiphysics problems that are solved with the finite element method. Exercises on the computer: input of the model geometry, generating a discretization grid, specification of physical material properties in the model.
- Case studies and exercises on the modeling of coupled problems: thermoelectric transport, capacitive and inductive sensors for static and quasistatic problems, structural mechanics, coupling an incompressible flow with energy transport, modeling of a fuel cell to convert chemical energy (hydrogen) into electrical energy.
- Advanced multiphysics modeling: "coefficient form" of a scalar conservation equation, conversion of a partial differential equation into the weak form. The weak form constitutes the basis for the finite element method.
- Model validation and recognition of the validity limits of a model.

Teaching and learning methods

- Frontal teaching
- Practical work with suitable software packages
- Exercises
- Private study and literature study
- Individual and group assignments

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Niveau Bachelor en physique et mathématiques (mécanique newtonienne, équations différentielles ordinaires, connaissances élémentaires en calcul vectoriel et à l'aide de matrices)
- Connaissances élémentaires de MatLab ou de logiciels semblables.

Brève description du contenu et des objectifs

Le module donne un aperçu de la modélisation et de la simulation d'effets couplés (multiphysique). Ce module donne un aperçu des différents domaines d'application de la modélisation et de la simulation multiphysique dans l'industrie. Les étudiants apprennent les procédures méthodiques nécessaires à la résolution de problèmes liés à la modélisation et à la simulation dans les divers domaines de la technique et de la physique. La

consolidation et l'approfondissement du savoir théorique se fait au moyen de quatre problèmes concrets qui seront résolus avec les méthodes et les programmes adéquats (MATLAB, Comsol Multiphysics).

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiant-e-s savent modéliser et simuler des systèmes locaux et des systèmes spatialement étendus tels qu'ils apparaissent dans les sciences de l'ingénierie. Ils savent en outre décrire un problème réel de manière physique et mathématique. Ils reconnaissent les symétries et sont en mesure de les mettre à profit. Ils sont conscients des simplifications possibles et de leur influence sur les résultats.

Les étudiant-e-s savent utiliser les différentes méthodes, les algorithmes et les progiciels d'éléments finis disponibles pour résoudre les équations différentielles, couplées et aux dérivées partielles. Ils apprennent à développer des modèles fiables, à les valider et à en déterminer les limites. Ils sont également en mesure de critiquer les résultats de simulation et d'en définir le domaine de validité.

Contenu des modules avec pondération du contenu des cours

- Modélisation de phénomènes physiques non reliés par application des principes de conservation et lois des matériaux: transport de masse, d'énergie, de charge et d'impulsion. La mécanique des structures et la mécanique des fluides sont également traitées durant le cours.
- Introduction à la modélisation des champs électromagnétiques (équations de Maxwell).
- Méthodes de discrétisation numériques pour résoudre les équations différentielles: méthode de la différence finie, méthode des éléments finis, méthode du volume fini et discrétisation de temps.
- Analyse d'un problème multiphysique qui peut être formulé et résolu analytiquement par des calculs manuels, par exemple transfert de charge et transport d'énergie dans une seule dimension).
- Introduction à la modélisation des problèmes multiphysiques à l'aide de l'approche FEM. Exercices pratiques sur ordinateur: description géométrique, maillage pour éléments finis, spécification des propriétés matérielles physiques.
- Etudes de cas et exercices de modélisation de problèmes reliés: conducteur thermoélectrique, des capteurs capacitifs et inductifs pour les problèmes statiques et quasi-statiques, mécanique structurelle, relier un flux incompressible au transport d'énergie, modélisation d'une pile à combustible pour convertir l'énergie chimique (hydrogène) en énergie électrique.
- Modélisation multiphysique avancée: "formule du coefficient générique" d'une loi de conservation scalaire, transformation faible d'une équation aux dérivées partielles. La formulation faible est un des fondements de la méthode des éléments finis.
- Modèle de validation et reconnaissance des limites.

Méthodes d'enseignement et d'apprentissage

- Cours magistral
- Travail pratique avec des progiciels appropriés
- Exercices
- Etude autonome et bibliographie
- Travaux individuels et en groupe

Linear algebra:

- Systems of linear equations, Gauss algorithm
- Basics of vector and matrix algebra, linear spaces

Analysis:

- Calculus with functions of one variable
- Zeros of functions (Newton algorithm)

Programming:

- Basics of procedural programming and ability to implement small programs in an arbitrary language, e.g. Python, Matlab, R, Java, C#, C++, C, etc.

Brief course description of module objectives and content

This course offers an introduction to optimization, emphasizing basic methodologies and underlying mathematical structures. Optimization refers to the application of mathematical models and algorithms to decision making. A large number of quantitative real-world problems can be formulated and solved in this general framework. Applications of optimization comprise, for instance, decision problems in production planning, supply chain management, transportation networks, machine and workforce scheduling, blending of components, telecommunication network design, airline fleet assignment, and revenue management.

Aims, content, methods

Learning objectives and acquired competencies

- The student has an overview of the various fields and approaches to optimization.
- The student has a basic mathematical and algorithmic understanding of the major optimization methods used in practice (Linear Programming (LP), Integer Programming (ILP), Nonlinear Programming, Optimization in Graphs, Metaheuristics).
- The student is able to analyze basic real-world decision problems and formulate appropriate optimization models.
- The student is able to implement and solve basic LP/ILP models in a spreadsheet.
- The student has developed a certain intuition on how to approach and analyze real-world optimization problems, to correctly estimate their complexity, and to choose appropriate modeling approaches and implementation tools.

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Knowledge and abilities at the level of a completed Bachelor's degree in:

- Differential and integral calculus
- Ordinary differential equations
- Matrix calculus
- Complex numbers

Brief course description of module objectives and content

In this module, students learn which class of dynamical phenomena can be described with systems of ordinary differential equations. They learn to recognize the fundamental behavior patterns of these systems and also to develop simulation models for them.

Aims, content, methods

Learning objectives and acquired competencies

- Description of dynamical phenomena with differential equations
- Analysis of system behavior
- Knowledge of fundamental behavior patterns, understanding the connection with system structure
- Development and simulation of models for dynamical systems
- Knowledge of numerical methods for solving systems of differential equations

Contents of module with emphasis on teaching content

- Topic 1: Modeling physical systems with differential equations, analysis of dynamical systems by way of example
- Topic 2: Analytical and numerical methods
- Topic 3: Systems of differential equations, state diagram, block diagrams
- Topic 4: Trajectories, equilibria, linear stability analysis, eigenmodes, the example of linear, time-invariant (LTI) systems
- Topic 5: Non-linear systems, bifurcation, chaos, discrete dynamical systems

Teaching and learning methods

Lecture units: lecture, working on and discussing short exercises

Tutorial units: working on and discussing set exercises

Private study: study of the literature, working on assignments and exercises

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Connaissances et aptitudes de niveau Bachelor accomplies dans les domaines suivants:

- Calcul différentiel et intégral
- Equations différentielles ordinaires
- Calcul matriciel
- Nombres complexes

Brève description du contenu et des objectifs

Ce module présente aux étudiants les types de phénomènes dynamiques que les équations différentielles ordinaires (EDO) permettent de décrire. Les étudiants analysent les modèles de comportement élémentaires de ces systèmes pour lesquels ils développent des modèles de simulation.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Savoir décrire des phénomènes dynamiques à l'aide des EDO
- Savoir analyser le comportement des systèmes
- Connaître les modèles de comportement élémentaires et comprendre le rapport avec la structure du système
- Savoir développer et simuler des modèles de systèmes dynamiques
- Connaître les approches numériques de la résolution de systèmes d'EDO

Contenu des modules avec pondération du contenu des cours

- Thème 1: Modélisation de systèmes physiques à l'aide des EDO, exemple d'analyse de systèmes dynamiques
- Thème 2: Méthodes analytiques et numériques
- Thème 3: Systèmes d'EDO, diagrammes de phase, histogrammes
- Thème 4: Trajectoires, équilibres, analyse de stabilité linéaire, modes propres, exemple des systèmes linéaires invariants dans le temps
- Thème 5: Systèmes non linéaires, bifurcation, chaos, systèmes dynamiques discrets

Méthodes d'enseignement et d'apprentissage

Cours magistral: cours, résolution et discussion d'exercices courts

Séances d'exercices: résolutions et discussions d'exercices

Etude autonome: étude de la littérature, résolutions d'exercices

Module Category

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

The course links topics well known from bachelor mathematics courses and extends them, in particular linear algebra, analysis and numerical mathematics. Expected competences:

Linear algebra: systems of equations, matrices, numerical methods

Analysis: partial derivatives, gradient, concept of ordinary differential equation, linear differential equations, separable differential equation, concept of fourier series.

Brief course description of module objectives and content

Foundations of the theory of partial differential equations relevant in engineering applications and their numerical solution.

Aims, content, methods

Learning objectives and acquired competencies

The student knows the basic geometric, analytic and numeric aspects of partial differential equations. He/she knows the basic methods to successfully solve partial differential equations analytically and numerically as well as a set of typical examples that allow to better understand the theoretical concepts.

Contents of module with emphasis on teaching content

Part 1: General theory

Goals of part 1:

- understand how partial differential equations naturally appear in applications
- be able to solve selected examples using the separation method
- understand the kinds of boundary conditions necessary, Dirichlet and Neumann boundary conditions
- create a collection of examples to illustrate the basic theoretical principles

Lesson plan for part 1:

1. From ordinary to partial differential equations: three applied examples: wave equation, Laplace equation and heat equation. Goal: understand how partial differential equations naturally appear in applications
2. Quasilinear partial differential equations of first order, solutions using characteristics.
3. Solution of partial differential equations using separation of variables.
4. Solution of partial differential equations using the Laplace- or Fourier-transforms.
5. Elliptic partial differential equation with the Laplace equation as the prime example. Poisson formula, maximum principle, uniqueness of solutions.
6. Parabolic differential equations with the heat equation as prime example. Maximum principle and kernel function, Green's function.
7. Hyperbolic partial differential equations with the wave equation as prime example. d'Alembert solution and method of characteristics.

Part 2: Numerical methods for partial differential equations

1. Analysis of finite difference methods in the example of the two point boundary problem:
 - condition
 - stabilityAnalysis of finite difference methods in the model problem transport equation.
Goal: understand some central ideas and concepts of the analysis of numerical methods in general and finite difference methods in particular.
2. Finite volume methods for the Poisson-equation:
 - Example of a cell centered finite volume difference method
 - Example of a node centered finite volume element methodBoundary elements for the Laplace equation.
Goal: construct a collection of numerical methods that represent the broadness of possible approximation techniques.
3. Finite element method in the example of the stationary heat equation:
 - differential, variational and integral formulation
 - global and local ansatz functions
 - elements and element types
4. General perspective: weighted residues.
Goal: concise introduction into the methodology of finite elements.
5. Problems of finite element methods in the example of the beam equation. Solution strategies and their numerical background:
 - p-strategies
 - h-strategiesExample based introduction to adaptive step size control.
Goal: show limitations of finite element methods
6. Finite elements in the example of the nonstationary heat equation:
 - semidiscrete schemata
 - completely discrete schemata
7. Eigenvalue determination using finite elements in the example of the beam oscillation equation.
Goal: illustrate additional fields of application for finite elements.

This module does not intend to teach the use of any particular software product for the solution of partial differential equations. Instead it strives to teach the foundations for their successful use. The students should become capable to judge the potential and limitations of such a software system and the precision and reliability of the results that can be expected from such a system.

- Optics: Basics of wave optics;
- Physics: The students are able to solve simple differential equations, know linear algebra and can handle electromagnetic forces and fields.
- Mathematics: Basics for engineers (bachelor Level)

Brief course description of module objectives and content

The module "Physics on micro and nano scale" focuses on physical effects and their applications in photonics, electrical engineering, medical engineering and mechanical engineering which become relevant, when technical systems get miniaturized. In the first step of miniaturization - from macro to micro – the principal physics remains unchanged, but the dominant physical effects change due to a changed surface to volume ratio.

Surface related effects become dominant. With further miniaturization – from micro to nano - quantum phenomena become dominant and lead to completely new physical concepts. When the typical size of objects is between several nanometers and a few micrometres we can observe a wealth of fascinating effects that today are the basis for applications from advanced sensing to medical applications, ultrasmall mechanical devices, nanophotonics etc.

A first main topic of this module relates to surface effects. Microstructured surfaces, for example, play an important role in mechanical systems in terms of nano-roughness and nanotribological properties. In nature, such microstructures lead e.g. to the Lotus effect or to different colour effects, and in medicine, micro and nanostructured surfaces help to significantly improve the acceptance of implants by the human organism. Another interesting topic is surface functionalisation, which can be designed to reduce e.g. wear, corrosion, ice-formation or bio-fouling on materials; surface functionalization is furthermore an important step in the design of chemical and biochemical sensors.

A second main topic deals with quantum effects that are related to spatial confinement in physical systems. The discretization of energy levels in atomic systems, for example, forms the basis for the understanding of light-matter interaction. Prohibited states in periodic solids lead to band gaps in semiconductors, which provide the basis for modern electronics. In a similar way, "forbidden" states can also be generated in dielectric periodic structures. The so called photonics band gaps enable completely new forms of light guidance in photonic crystals. Quantum dots and quantum wires are further quantum objects that have an important meaning in modern electronics.

A third topic covers new materials structures on the micro and nanoscale. Nanoparticles and nanofibers in biology and medicine offer completely new opportunities in diagnostics and research. Graphene consists of only one layer of carbon atoms and has been the subject of the most modern research since its discovery. The unique properties of the thinnest material in the world could be used in many different ways - for mechanical components, solar cells, medical sensors or in electronics, due to its enormous conductivity and the quantum Hall effect, which already occurs at room temperature. Nanoparticles and nanostructures also play an important role in the field of nanophotonics. The interaction of light with nanostructures leads to novel effects such as plasmonics and opens up new possibilities in optoelectronics and microelectronics.

Aims, content, methods

Learning objectives and acquired competencies

After completion of this module the students will:

- know the fundamental aspects of quantum mechanics and understand the quantum nature of the nanoworld
- know the phenomena of nano- and microstructures influencing surface and material properties (e.g. structural colours, tribo-mechanical and wetting behaviour)
- know the processes that govern the functionalisation of surfaces
- know the fundamental quantum mechanical concept of discretization and resulting consequences such as discrete energy states, electronic and photonic band gaps, quantum dots and quantum wires and their applications in modern photonics, electronics and medicine
- know the function and application of nanoparticles and nanofibers in biology and medicine
- know the interaction of light with dielectric, semiconductor and metallic nanoparticles (incl. plasmonics)

Contents of module with emphasis on teaching content

- From macro to micro to nano: scaling of physical systems and the consequences (3 lessons)
- Quantum mechanics and Quantum Nature of the Nanoworld: Schrödinger equation, discrete energy levels, sizing effects (6 lessons)
- Nano- and microstructured surfaces: Physics of nano tribology, structural colours, and nanostructures for medical applications (6 lessons)
- Functional surfaces: Physics of wetting behaviour, adhesion, and applications (e.g. wear reduction, anti-icing or anti-sticking surfaces, surfaces for fluidic and sensor applications) (6 lessons)
- Electronic and photonic bandgaps: Physical basics and applications (6 lessons)
- Quantum dots and quantum wires: ISFETs (ion-sensitive field-effect transistors) and BioFETs (field effect biosensors) for electronics and biotechnology (3 lessons)
- Nanoparticles and fibers: Basics and applications in medicine, biology, and sensor developments (6 lessons)
- Nanophotonics: Interaction of light with nanoparticles and nanostructures (dielectric, metallic, semiconductor) (6 lessons)

Compétences préalables

Connaissances préalables, compétences initiales

Les étudiants-e-s connaissent les bases de la physique. Notamment les concepts comme l'énergie, la force, l'énergie thermique $k_B T$, la chaleur spécifique, les oscillations, la fréquence de résonance, les ondes, les vecteurs du champ électromagnétique: \mathbf{E} , \mathbf{D} , \mathbf{B} and \mathbf{H} , la capacité électrique C , la constante diélectrique ϵ_{ps} , et le modèle de Bohr des atomes sont obligatoires. De plus, des simples équations différentielles et les nombres complexes, en particulier $e^{-i\omega t}$ sont aussi nécessaires.

Brève description du contenu et des objectifs

Les étudiants-e-s comprennent et savent appliquer les principes de base des composants électroniques et des dispositifs techniques importants, en faisant appel aux propriétés des matériaux et en appliquant des concepts microscopiques. Ces concepts comprennent les électrons et les trous dans les solides, les bandes d'énergie des métaux et semi-conducteurs, le mécanisme de polarisation dans les matériaux piézoélectriques et diélectriques, les dipôles élémentaires dans la matière magnétique et l'accouplage des électrons dans les supraconducteurs (paires de Cooper). Ces concepts

permettront de discuter des applications actuelles, notamment les thermocouples, les cellules solaires photovoltaïques, les diodes lumineuses (LED), les actionneurs piézo-électriques, les capteurs et les systèmes de stockage de données magnétiques. Le module permettra aux étudiant-e-s de comprendre des concepts modernes dans le domaine des technologies innovatrices et de les utiliser à l'avenir.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiant-e-s

- connaissent les principes de base de la cristallographie, les réseaux de Bravais ainsi que les différents défauts au sein des cristaux.
- comprennent la conductivité thermique et électrique dans les solides sur la base de la description cinétique des particules
- connaissent les principes de base de la mécanique quantique et savent appliquer l'équation de Schrödinger
- savent mettre en relation la conductivité thermique et électrique par le biais des modèles microscopiques
- sont capables d'expliquer les principes des thermocouples, des diodes et des Lasers en utilisant les notions de bandes d'énergie, énergie de Fermi, potentiel de contact et l'émission stimulée.
- savent expliquer l'origine physique et la réalisation technique de la résolution nanométrique des microscopes à balayage de surface (microscope à force atomique et microscope à effet tunnel)
- connaissent la classification des matériaux magnétiques et des exemples de leurs applications techniques
- comprennent la différence entre l'effet Meissner d'un supraconducteur et le comportement de la matière parfaitement diamagnétique
- sont capables de résoudre des problèmes quantitatifs exemplaires en relation avec toute la matière du module

Contenu des modules avec pondération du contenu des cours

Sont étudiés des concepts élémentaires concernant les propriétés des matériaux, en mettant l'accent sur les applications. Le module se divise en cinq parties avec une pondération équivalente:

1. Cristallographie et mécanique quantique
 - Principes de base de la cristallographie, réseaux de Bravais
 - Défauts dans les cristaux
 - Principes de base de la mécanique quantique, effet photoélectrique et Compton
 - Application de l'équation de Schrödinger
2. Concept de la conductivité thermique et électrique dans les solides
 - Fluctuation thermique, bruit et activation thermique (diagrammes d'Arrhenius)
 - Conductivité thermique (loi de Wiedemann-Franz)
 - Conductivité électrique (modèle de Drude, vitesse de dérive, temps de relaxation)
 - Dépendance de la température de la résistivité des métaux parfaits
3. Concept des bandes énergétiques dans les semi-conducteurs, métaux et isolants
 - Electrons et trous, masse effective de l'électron
 - Dopage: type n, type p
 - Ensembles de particules, statistique de Fermi-Dirac
 - Contacts: jonction idéale p-n (diode), contact entre métaux purs, thermocouples
 - Dispositifs techniques: cellule solaire photovoltaïque, diode lumineuse (LED), laser semi-conducteur
4. Matériaux piézoélectriques et diélectriques
 - Mécanismes de polarisation
 - Piézoélectricité, actionneurs et capteurs, microscope à effet tunnel et microscope à force atomique (STM/AFM)
 - Constante diélectrique et sa dépendance de la fréquence
 - Indice de réfraction et dispersion
 - Absorption de lumière
5. Propriétés magnétiques et supraconductivité
 - Magnétisation et perméabilité magnétique
 - Classification des matériaux magnétiques: diamagnétiques, paramagnétiques, ferromagnétiques, antiferromagnétiques, ferrimagnétiques
 - Domaines magnétiques et stockage de données par voie magnétique
 - Supraconductivité: résistance zéro et densité de courant critique, applications des champs magnétiques importants
 - Mesure du champ magnétique: effet de Hall, quantification du flux magnétique et SQUID (Superconducting Quantum Interference Device)

Méthodes d'enseignement et d'apprentissage

Enseignement direct: présentation et discussion des concepts fondamentaux

Exercices: résolution quantitative de problèmes et analyse des concepts physiques des dispositifs d'application technologique

Etudes autonomes en utilisant un livre défini

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Basic knowledge of statistics on the level of an introductory stochastics course. Linear algebra: matrix-vector calculations. Basic Calculus. Familiarity and experience with programming, in particular with scripting languages like Matlab, Python or R. We will provide the students with a self-test to assess their prior knowledge in statistics and scripting.

Brief course description of module objectives and content

This course will provide an introductory review of the basic concepts of probability and statistics to understand probability distributions and to produce rigorous statistical analysis including estimation, hypothesis testing, and confidence intervals. Students will be introduced to the basic concepts of predictive modelling which by definition is the analysis of current and historical facts to make predictions about future events. Students will learn several techniques that account for many business and engineering applications of predictive modelling. These include regression techniques, time series models, and classification methods. Applicability and limitations of these methods will be illustrated in the light of data sets and analyses using

the statistical software R.

Aims, content, methods

Learning objectives and acquired competencies

Students are able to analyze data by means of regression analysis. They are familiar with important statistical forecasting methods and are able to calculate, evaluate and interpret predictions. They are able to choose an appropriate statistical method for a regression, classification or time series problem. They are able to evaluate and compare statistical models.

Contents of module with emphasis on teaching content

Fundamental concepts of probability and statistics (repetition of basic courses): concept of random variable, important probability distributions, covariance, parameter estimation, hypothesis testing, and confidence intervals.

Regression analysis: Simple linear regression with parameter estimation, graphical model validation, transformation of variables, confidence and prediction intervals for parameters. Multiple linear regression with parameter estimation, statistical tests and confidence intervals for parameters, and variable selection.

Classification: Concepts of classification, logistic regression, CART, random forests and model evaluation by cross-validation.

Time series analysis: STL decomposition, confidence and prediction bands, AR models with parameter estimation, confidence and prediction bands, autocorrelation, and model selection.

Teaching and learning methods

Lecture and practical work on computer with the statistics software R.

Literature

Lecture notes will be available in addition to recommended book chapters.

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Fundiertes Methodenwissen in der eigenen Disziplin, Grundkenntnisse in Projektmanagement

Kurzbeschreibung der Inhalte und Ziele

Die Fähigkeit über die eigene Disziplingrenzen hinweg erfolgreich mit Anderen zusammenzuarbeiten ist eine geforderte Kompetenz von Masterstudierenden. Wie geht die eigene Disziplin, wie gehen andere Disziplinen an Planungsaufgaben heran? Wie lassen sich Unterschiede in der Denk- und Arbeitsweise benennen, wie die Zusammenarbeit über Kultur-, Fach- und Disziplingrenzen hinweg produktiv gestalten?

Diese Zusammenarbeit wird im Rahmen der erweiterten theoretischen Grundlagen im Modul Planungsmethodik in der Theorie vermittelt und die Anwendung in einem Semesterprojekt trainiert.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Reflektieren der spezifischen Herangehensweise der eigenen Disziplin und anderer Disziplinen an Planungsaufgaben (interdisziplinäre Zusammenarbeit).

Kennen und Verstehen der Transfermechanismen zwischen verschiedenen Disziplinen sowie zwischen Wissenschaft und Praxis (transdisziplinäre Planungsmethoden).

Modulinhalt mit Gewichtung der Lehrinhalte

- Planungsmethodische Grundlagen und Techniken
- Interkulturelle Kompetenzen
- Vorgehensmodelle in inter- und transdisziplinären Projekten
- Analyse- und Prognosemethoden
- Wissensmanagement
- Prinzipielle Gesamtlösungen
- Aushandlungsprozesse
- Modelle und Indikatoren
- Semesterprojekt Planungsmethodik

Instruction				X E 100%
Documentation				X E 100%
Examination				X E 100%

Module Category

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

1. Basis calculus (integration, differentiation, ordinary differential equations, complex numbers, Fourier transform)
2. Basic probability theory (probability, conditional probability, expectation, variance, random variable)
3. Linear algebra (matrix algebra, eigenvalues)

Brief course description of module objectives and content

The ubiquitous presence of uncertainty and noise in the engineering sciences makes it mandatory to understand and quantify random phenomena. To achieve this goal the course will provide a solid introduction to the theory of stochastic processes. Special attention is given to applications. The applications include examples from various fields such as communications and vision, signal processing and control, production and traffic flows, queueing theory, financial market and physics of small systems (Brownian motion).

Aims, content, methods

Learning objectives and acquired competencies

The student is familiar with the main working tools and concepts of stochastic modelling (expectation, variance, covariance, autocorrelation, power spectral density). He/She is able to explain properties and limitations of stochastic processes (mainly Markov processes) as a modelling tool for noisy systems. He/She will be able to model and analyze simple random phenomena through adaptation of proposed stochastic models.

Contents of module with emphasis on teaching content

- Probability review: random variables, conditional probabilities, theorem of large numbers, central limit theorem.
- General introduction to discrete and continuous stochastic processes. Applications: communications, Kalman filtering.
- Discrete, continuous and hidden Markov Chains. Applications: stochastic manufacturing systems, queuing systems, pattern recognition, speech recognition.
- Bernoulli, Poisson, Gaussian Processes, Brownian motion, white and coloured noise.

Teaching and learning methods

Ex cathedra teaching

Presentation of simulation results and case studies

Literature

The script is, in principle, sufficient. Further readings are:

1. Sheldon M. Ross, Probability Models, Elsevier.
2. John A. Gubner, Probability and Random processes for electrical and computer Engineers, Cambridge University Press.
3. Mario Lefebvre, Applied Stochastic Processes, Springer.
4. Bassel Solaiman, Processus stochastiques pour l'ingénieur, PPUR.

Instruction				X E 100%
Documentation				X E 100%
Examination				X E 100%

Module Category

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Physics, analysis, linear algebra at Bachelor's level ,
- The mathematical prerequisites are covered by the chapter 7-9 of [4]. The summaries of these chapters are in the appendix of this document.

Brief course description of module objectives and content

The course starts with an overview of classical engineering physics with special emphasis of balance and constitutive equations (i.e., continuity equations and material laws). The basic concepts of vector analysis are applied to electrodynamics, various transport phenomena, mechanical elasticity and piezo-electric effects. The concept of tensors enables the description of important anisotropic effects of solid state physics. These effects are present in crystals as well as in layered material systems, which are more and more used in modern technology. The given overview facilitates the

student's understanding and application of numerical simulation methods (e.g., FEA, multiphysics).

Aims, content, methods

Learning objectives and acquired competencies

- Students are familiar with the most important basic laws of engineering physics for isotropic materials in general view form, recognize analogies between different application areas and exploit these for analyzing systems
- Students know about the generalization of the laws for anisotropic materials and can interpret these, especially with regard to application in numerical simulation
- Students master vector analysis and the algebra of tensors together with the standard notation conventions
- Students understand the basics of electrodynamics and transport phenomena for anisotropic systems
- Students understand mechanical elasticity with 3D strain and stress states and are familiar with the material laws in general form for isotropic and anisotropic bodies
- Students understand the piezo-electric effect and its applications in engineering (sensors and actuators)

Contents of module with emphasis on teaching content

- Recapitulation of isotropic material laws (Ohm, Hook, electric polarization, heat conduction)
- Introduction to vector and tensor calculation: scalar, vectorial and tensorial parameters, tensor algebra,
- Transformation behavior of vectors and tensors
- Hands-on calculation of vector analysis and tensor algebra: electrodynamics and anisotropic transport phenomena
- Elasticity theory with emphasis on 3D stress states
- Piezo-effect: physical fundamentals

Week	Subject
MW1	Introduction, motivation, repetition of fundamental physical laws from engineering physics
MW2	Scalars, vectors, divergence, gradient, curl
MW3	Integral theorems and applications of vector analysis in physics
MW4	Maxwell I: Electro- and magnetostatics
MW5	Fundamental mathematical properties of tensors, transformations of tensors
MW6	Transport phenomena, Ohm's law, heat conduction and diffusion
MW7	Elasticity: stress and distortion tensor, thermal expansion
MW8	Elasticity: Hooke's law, tensors of the fourth rank, engineering diagram
MW9	Elasticity: 3D stress and distortion states
MW10	Elasticity: 3D stress and distortion states
MW11	Reserve
MW12	Maxwell II: Electrodynamics
MW13	Maxwell III: Waves, Maxwell
MW14	Piezoelectricity

FTP Fundamental theoretical principles

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Good knowledge of programming, algorithms and discrete mathematics.

Brief course description of module objectives and content

The aim of this module is to deepen some basic theoretical aspects of computer science. The master students will learn that ...

- formal languages and automata are essential concepts to describe different types of problems and computations;
- Computability/decidability are central to explain that for many problems seem to have an intuitive solution, although they can not be solved by algorithms;
- Complexity deals with the amount of time required to solve a problem, and there are many very practical problems that can not be solved in reasonable time or space.

Aims, content, methods

Learning objectives and acquired competencies

- The students understand that three different mathematical formalisms (finite state automata, regular grammars, regular expressions) are equivalent and define the set of regular languages. Finite state automata and regular expressions are widely used and will be explained using examples from lexical analysis, modeling of simple state-based systems, telecommunications protocols and program verification.
- The students realize that programming languages with regular languages can not be fully described. Context-free grammars, on the other hand, are suitable for developing all modern programming languages. Parsing is closely linked to the context-free languages. Using parser generators, students can explain top-down and bottom-up parsing.
- The students know that many problems are undecidable, i.e. that there are no algorithms to solve them, or rather that not everything is predictable. Such intuitively difficult to understand problems occur e.g. in the case of operating systems (deadlock problem), object-oriented programming languages (subtype decision) or program verification.
- The students understand that decidable problems are classified according to the resources needed to solve them (time or space) and know the major complexity classes (P, NP, EXP, PSPACE), their differences, and interrelationships (e.g., hierarchy).
- The students understand the concept of nondeterminism, which plays an essential role in the study of complexity. The complexity class NP (nondeterministic polynomial time) includes a subclass of very practical problems that are not solvable in reasonable time. Cryptology, machine vision, various optimization problems and many other areas are affected by such problems. Students can demonstrate that such problems are indeed unsolvable in reasonable time, and know some ways to circumvent this limitation through approximation techniques. Many problems known as NP-complete are presented and investigated.

Contents of module with emphasis on teaching content

The module is divided into three parts:

1. Languages and automata (about 36 %)
 1. Alphabets, words, formal languages, grammars
 2. Finite state automata, regular languages/grammars, regular expressions, nondeterminism
 3. Pushdown automata, context-free languages/grammar
 4. Turing machines
2. Computability/decidability (about 21 %)
 1. Various computation models, Church-Turing thesis
 2. Reduction of a problem to another
 3. Decidable/undecidable problems
 4. Computable/uncomputable functions
3. Complexity (about 43 %)
 1. Types of complexity (time, space)
 2. Complexity classes, polynomial time complexity, NP, polynomial time reductions, NP-completeness
 3. Approximation methods

Teaching and learning methods

- Frontal teaching
- Presentation and discussion of theoretical topics

- Discussion of practical examples to reduce the gap between theory and practice
- Exercises and self-study of selected topics

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

The students are expected to have knowledge of the basics of Fluid Dynamics / Aerodynamics, Structural Mechanics, Thermodynamics (Gas Turbines), and Systems Engineering.

An interest in Aircraft Systems is important.

The knowledge of simulation tools (Matlab, Simulink, Modelica, Comsol, etc.) and performance calculations or optimization calculations is an advantage.

Brief course description of module objectives and content

The course will focus on the design of advanced aircraft systems, aiming towards more electric types of aircraft for a new generation beyond the Airbus A380 and Boeing 787.

Today, aircraft design is more than just aerodynamics, flight dynamics, propulsion, and structures. The new technologies require a systems engineering approach, which guides the way towards a sustainable aircraft.

The whole design process will be discussed and the students will learn to do a preliminary design concept.

In this module, the whole design process of a complex system such as an aircraft will be discussed and the students will learn how to do a preliminary design concept. The course is structured in lectures as well as a conceptual aircraft design case study, which will be done in groups.

Aims, content, methods

Learning objectives and acquired competencies

The students will learn how the design process of a complex system such as an aircraft is done, with a focus on the early stages between concept and the preliminary design stage.

All important disciplines, which play a key role in aircraft design, will be addressed: weight, performance, reliability, operation and maintenance costs.

The students will be able to understand the architecture of modern aircraft, focussing on the advancing system integration with the trend towards electric and more environmentally sustainable aircraft.

The students can apply the current design standards and analyze the design of new aircraft for the efficiency and performance of the operation.

Learning experience working in a design team to define an aircraft concept.

Contents of module with emphasis on teaching content

The course will start with an introduction to aircraft conceptual design.

The aerodynamics for wing design, propulsion technology, and engine integration and the electrical, hydraulic and pneumatic systems will be discussed to provide an aircraft architecture from the system point of view.

The available methods of aircraft design optimization will be discussed in the light of perfect design or an illusion of the existence of such.

The concept of increasingly electrical aircraft will be introduced and the concept of hybrid propulsion with new aircraft layouts will be discussed.

The course will close with the outlook to new aircraft generations to meet the reduction of CO₂ and noise footprint.

Teaching and learning methods

- Lectures with focus on practical cases for commercial airplanes
- Self study and performance of literature research
- Performance of a case study for an aircraft design working together with teams which cover different design aspects
- Final presentation of aircraft design as team effort

Literature

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Linear algebra (vectors, matrices, homogeneous coordinates), C/C++ programming, 3D computer graphics (basic real-time rasterization)

Brief course description of module objectives and content

The goal of this course is to provide theoretical and practical insights on selected topics related to the algorithms and solutions adopted by modern real-time 3D Computer Graphics (CG) systems.

This class relies on in-depth, hands-on experiences with the implementation of recent GPU programming techniques for increasing the realism and performance of 3D rendering software to deal with complex synthetic images featuring a more accurate lighting model, shadows, multiple post-processing filters, correct transparency, etc.

Aims, content, methods

Learning objectives and acquired competencies

Through this course, the student acquires a better understanding of the ecosystem, the technology and mathematics behind current generation's real-time rendering software, and gets solid foundations to further move in this field on his/her own.

The course contents are not only approached from a theoretical or introductory point of view, but always discussed in-depth and supported by their direct, effective implementation (via tutorials and assignments) on dedicated hardware.

Thanks to the direct experience gained in dealing with the complexity of modern GPU programming and selected state-of-the-art techniques used by the leading industry, students can integrate similar solutions in their projects.

Contents of module with emphasis on teaching content

The module covers the following topics:

- GPU programming via a modern API and with particular focus on performance implications.
- Realistic lighting through Physically-Based Rendering (PBR), global illumination, real-time ray tracing and shadow mapping.
- Deferred rendering: advantages and limitations.
- The problem of correct Order-Independent Transparency (OIT) and its solutions.
- Post-processing effects to enhance image quality: anti-aliasing, High-Dynamic Range (HDR), tone mapping and ambient occlusion.

Teaching and learning methods

Lectures, tutorials, demos and practical work on computer and dedicated hardware. Students will be asked to implement selected techniques on their own as assignment.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

- Differential equations, Transfer functions
- PID-controller design and implementation incl. anti-windup strategies
- control system structures: feed-forward, cascaded control
- Analysis of feedback control systems (stability, phase/gain margin, performance in time and frequency domain)
- State space models
- Loop shaping controller design
- Linear algebra (Eigenvalue Decomposition)
- It is necessary, that the student has successfully completed 2 semester courses in feedback control

Brief course description of module objectives and content

Model-based controller design is a key technology to control systems with complex dynamics. It was the enabling technology for many innovations in the last decade. In this module, the key elements of the development process are addressed: system identification, LQR/LQG-Controller design and controller implementation. Since there is always model uncertainty, the course ends with an introduction to robust controller design using H-Infinity.

Aims, content, methods

Learning objectives and acquired competencies

The student is able to

- completely design a model-based, robust feedback control law, including modelling, parameter estimation, system analysis, controller design and controller implementation
- design a robust H-Infinity optimal controller.

Contents of module with emphasis on teaching content

- LQR/LQG-Controller design (5W)
 - State space models and their properties, linearization, singular values, realisation theory, basic state feedback control
 - Observer design
 - LQR/LQG controller design with Loop Transfer Recovery (incl. integral controller action), SISO and MIMO-Systems
- Introduction to system identification (4W)
 - Models, design of experiments, signal conditioning
 - Least Square, recursive methods
- Important aspects of controller implementation (2W)
 - Controller discretization, sampling time
 - Quantisation effects
- Robust Control (3W)
 - H-Infinity controller design

Teaching and learning methods

Lectures, exercises, case studies

A self-evaluation exam is provided to check the skills necessary to follow the course

Catégorie de module

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Fonctions de transfert
- Synthèse d'un régulateur PID avec implémentation, méthodes anti-windup incluses
- Structures du systèmes réglés : commande apriori (feedforward), commande en cascade
- Analyse des boucles de réglage (stabilité, marges de phase/gain, performance dans les domaines temporel et fréquentiel)
- Modèles dans l'espace d'état
- Synthèse du réglage par «Loop shaping»
- Algèbre linéaire (décomposition en valeurs propres)
- L'étudiant doit avoir suivi au moins deux cours consécutifs de réglage au niveau Bachelor

Brève description du contenu et des objectifs

La synthèse d'un régulateur basée sur un modèle est une technologie clé pour maîtriser les systèmes dynamiques complexes. D'importantes innovations réalisées ces dernières années relèvent de cette technologie. Dans ce module, des éléments importants du processus de développement de tels systèmes seront traités, notamment l'identification de systèmes dynamiques, la synthèse et l'implémentation de régulateurs LQR/LQG. Une introduction à la synthèse H-infini des régulateurs robustes sera donnée à la fin du module.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

L'étudiant est capable de...

- mettre au point un réglage complet basé sur un modèle, incluant la modélisation, l'estimation de paramètres, l'analyse du système, la synthèse et l'implémentation du régulateur;
- mettre au point un réglage robuste H-infini.

Contenu des modules avec pondération du contenu des cours

- Synthèse de régulateur LQR/LQG (5S)
 - modèles dans l'espace d'état et ses propriétés, linéarisation autour d'un point de fonctionnement, valeurs singulières, synthèse et réalisation de régulateurs par retour d'état.
 - Synthèse de l'observateur
 - Synthèse de régulateur LQR/LQG avec «Loop Transfer Recovery», (y compris régulateur avec action intégrale) pour systèmes mono- et multivariables (SISO, MIMO)
- Introduction à l'identification des systèmes dynamiques (4S)
 - types des modèles
 - méthode d'estimation par moindres carrés, méthodes récursives
 - conception de l'expérimentation, conditionnement du signal
- Aspects importants de l'implémentation de régulateurs (2S)
 - discrétisation du régulateur temps continu, choix de la période d'échantillonnage
 - effets de la quantification
- Réglage robuste: (3S)
 - H-infini-synthèse de régulateurs

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Database design
- Relational Model
- Normalization
- SQL
- Object relational database systems
- Object-oriented programming languages

Brief course description of module objectives and content

The Internet, new types of data and applications and new business requirements have driven the development of data management systems having data models and architectures beyond traditional relational and object-relational systems and centralised architectures.

The course covers the following core topics:

- Distributed and parallel database systems architectures, internals and services such as transaction processing, concurrency control and query processing
- No-SQL Systems
- Data processing architectures
- Distributed Ledger Technology and Blockchain

Aims, content, methods

Learning objectives and acquired competencies

Students understand how to use database technologies to process and manage large data collections.

- They know databases alternatives beyond Relational and Object Relational systems and are able to decide which database system is appropriate depending on the context, and depending on the kind of data available
- They can design and implement Systems based on different architectures
- They understand the functioning of internal components of a database system
- They can reuse the material acquired in this course in their own working environment and apply them to solve their specific problems
- They know the current research directions of these domains.

Contents of module with emphasis on teaching content

The module is organised around the following core subject areas:

- Parallel databases (30%)
- Distributed databases (30%)
- No-SQL databases (25%)
- DLT and Blockchain (15%)

Contents:

- Parallel architectures
- Serializability
- Distributed architectures
- Replication
- CAP
- Distributed Consensus
- Eventual consistency
- DLT and Blockchain
- Hadoop and MapReduce
- Data processing with Spark
- Stream processing
- Document systems
- Graph systems
- Key value systems
- Column family stores

Teaching and learning methods

- Lectures with integrated exercises
- Self study of literature
- case studies

Literature

Lecture slides, references to internet resources and books

Assessment

Certification requirements

Module uses certification requirements

Certification requirements for final examinations (conditions for attestation)

The successful delivery of solved exercises is condition for entering the examination, but will not contribute to final mark.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

The student must have knowledge and experience in the following areas:

- Circuit analysis
- Electrical and magnetic fields
- Active and passive electronic components, operational amplifiers
- AD and DA conversion principle
- Digital circuits

Brief course description of module objectives and content

This Advanced Electronic Design module gives to the students the key elements for the development of high performance electronic systems. These systems are characterized by:

- a mixed-signal PCB (Printed Circuit Board)

- the presence of sensitive analogue circuits and signals
- the presence of complex and high-speed digital ICs (Integrated Circuits)

Aims, content, methods

Learning objectives and acquired competencies

- The student masters the technologies used in the development of high-performance printed circuit boards.
- The student is able to design a high-performance electronic board composed of sensitive analogue, mixed signal and high speed digital circuits.
- The student is able to implement high-speed and high-resolution signal processing chains based on A/D and D/A converters, analogue functions blocs and complex digital ICs

Contents of module with emphasis on teaching content

The topics of this module can be grouped into three different subject areas. Therefore three courses are proposed. Each course is taught by a different person.

Course	Title	Weeks	Emphasis
1	High-performance PCB development : <ul style="list-style-type: none"> • PCB technologies: materials, multi-layers, micro vias • PCB design: EMC, signal integrity, grounding and power supply routing, decoupling, transmission lines and effects, simulation tools • Board assembly: IC package, chip-on-board, soldering, heat transfer, testability 	1 – 4	~30%
2	High-speed digital electronic design : <ul style="list-style-type: none"> • high-speed signaling and timing, clock distribution, skew, jitter, latch-based design, low-power 	5 – 8	~30%
3	Advanced analogue electronic design : <ul style="list-style-type: none"> • Advanced operational amplifier applications: low level and sensor signal conditioning, electronic noise, high-speed and low-power amplifiers, frequency response analysis • Advanced ADC and DAC implementations: high-speed, high-resolution, sigma-delta converter, low-power, anti-aliasing and post-filter 	9 – 14	~40%

Teaching and learning methods

- Lecture
- Exercises
- Presentation and discussion of case studies
- Self-study of the presented cases and exercises

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

L'étudiant a des connaissances de base et expériences dans les domaines suivants :

- Analyse de circuit
- Champs électriques et champs magnétiques
- Composants électroniques actifs, passifs et amplificateurs opérationnels
- Principe de conversion AD et DA
- Conception de circuits numériques

Brève description du contenu et des objectifs

Le module Advanced Electronic Design fournit à l'étudiant les éléments clés du développement de systèmes électroniques de haute performance. Ces systèmes se caractérisent par:

- un circuit imprimé (PCB) composé de signaux analogiques et numériques

- la présence de circuits et de signaux analogiques sensibles
- la présence de circuits intégrés (IC) numériques complexes et ultrarapides

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- L'étudiant maîtrise les technologies utilisées dans le développement de circuits imprimés à hautes performances.
- L'étudiant est capable de concevoir une carte électronique haute performance composée de circuits analogiques sensibles et de signaux numériques ultrarapides.
- L'étudiant est capable d'exécuter des chaînes de traitement de signaux ultrarapides à haute résolution basées sur des convertisseurs A/D et D/A, des blocs de fonctions analogiques et des circuits intégrés numériques complexes.

Contenu des modules avec pondération du contenu des cours

Les sujets de ce module peuvent se regrouper en trois domaines. Par conséquent, trois cours sont proposés. Chaque cours sera dispensé par une personne différente.

Cours	Titre	Semaines	Pondération
1	Développement de PCB haute performance : <ul style="list-style-type: none"> • Technologies PCB : matériaux, multitouches, micro vias • Conception de PCB : EMC, intégrité du signal, mise à la masse et distribution de l'alimentation, découplage, lignes de transmission, outils de simulation • Assemblage de carte : boîtiers, montage sur carte, soudage, transfert thermique, testabilité 	1 – 4	~30%
2	Conception d'électronique numérique à haute vitesse : <ul style="list-style-type: none"> • signalisation ultrarapide, analyse timing, distribution d'horloge, décalage, gigue, conception à base d'éléments mémoires, basse consommation 	5 – 8	~30%
3	Conception électronique et analogique avancée : <ul style="list-style-type: none"> • Applications avancées d'amplificateurs opérationnels : conditionnement du signal de capteurs à faible niveau, bruit électronique, analyse fréquentielle, amplificateurs ultrarapides et à basse consommation, outils de simulation • Mise en œuvre avancées de circuits AD et DA : haute vitesse, grande résolution, convertisseur sigma-delta, basse consommation, anti-aliasing et filtre de sortie 	9 – 14	~40%

Méthodes d'enseignement et d'apprentissage

- Cours magistral
- Exercices
- Etudes de cas
- Etude personnelle des cas et exercices présentés

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences
Prerequisites, previous knowledge

Basic engineering knowledge of structural mechanics, analysis and linear algebra as well as FE element simulation at Bachelor level of Mechanical Engineering studies.

A brief summary of relevant engineering mechanics concepts will be provided prior to the lecture as a self-study revision course.

Brief course description of module objectives and content

This course provides a comprehensible introduction to basic concepts of continuum mechanics, material modelling and failure assessment for metals and polymers.

The students learn the fundamentals of tensor algebra and gain comprehensible insight into the governing mechanical and thermo-mechanical concepts of continuum mechanics. On this basis, an overview is given of state of the art material models for metals and polymers to empower students

to competently select advanced material models as implemented in modern Finite Element tools. Finally, the lecture provides a clear insight into the microstructural foundations of failure in metals as well as an overview of mechanical assessment methods as applied in engineering practice. The course is accompanied by regular exercises and hands-on workshops in which advanced material models and assessment methods are applied to practical problems.

Aims, content, methods

Learning objectives and acquired competencies

Week	Subject
MW1	Basic Tensor Algebra & Calculus 1 - Vector and tensor algebra
MW2	Basic Tensor Algebra & Calculus 2 - Selected tensor properties and problems - Tensor calculus
MW3	Continuum Mechanics 1 - Basic definitions - Kinematics of continuums
MW4	Continuum Mechanics 2 - Kinetics of continuums
MW5	Continuum Mechanics 3 - Equilibrium equations, equations of motion - Overview of balance laws
MW6	Material Behaviour & Models for Metals 1 - Material behaviour overview - Basic modelling principles - Elasticity
MW7	Material Behaviour & Models for Metals 2 - Plasticity - Visco-plasticity, creep / relaxation
MW8	Failure Mechanisms & Assessment Methods 1 - Failure mechanisms of metals - Static assessment methods for metals
MW9	Failure Mechanisms & Assessment Methods 2 - Fatigue assessment methods for metals
MW10	Workshop 1 Application of Material Models and Assessment Methods for Metals
MW11	Material Behaviour & Models for Polymers 1 - Material behaviour overview - Plasticity (influence of hydrostatic pressure) - Hyperelasticity
MW12	Material Behaviour & Models for Polymers 2 - Visco-elasticity, visco-plasticity, creep / relaxation - Cohesive zone models for bonded interfaces
MW13	Material Behaviour & Models for Polymers 3 - Parameter identification and optimisation methods
MW14	Workshop 2 Application of Material and Damage Models for Polymers

Contents of module with emphasis on teaching content

- Students are familiar with basic tensor algebra to understand fundamental continuum mechanical concepts.
- Students are familiar with the building blocks of continuum mechanics such as kinematics and kinetics concepts as well as equilibrium equations and balance laws as governing equations of mechanical problems.
- Students have a broad understanding of the basic material behaviour of metals and polymers including elasticity, hyperelasticity, plasticity, visco-elasticity, visco-plasticity and creep / relaxation as well as isotropy, orthotropy and anisotropy.
- Students are able to appropriately select and deploy linear and non-linear material models in Finite Element simulations.
- Students know the basic failure mechanisms for metals and polymers; they are able to select appropriate mechanical assessment methods and perform basic assessments.

Teaching and learning methods

Frontal Teaching (ca. 60%), exercises and 2 workshops incl. Finite Element application (ca. 40%)

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Good knowledge of object-oriented programming.

Brief course description of module objectives and content

A wealth of fascinating technologies exists alongside the ubiquitous object-oriented programming and the inadequate testing methods. This module introduces students to the most relevant of these emerging technologies from a general programming-language point of view.

Paradigms Besides object-orientation as today's mainstream programming paradigm, other quite different paradigms have been developed and brought to maturity during the last decades: in particular functional programming, but also logic and constraint programming. None of these paradigms is well suited to solving all the different kinds of problems but each has its own particular strengths in specific areas. Since modern software encompasses many such areas, simultaneous application of several paradigms seems appropriate, and consequently, their seamless integration into

multi-paradigm languages.

Types Programming languages with a rich and consistent type system make it possible to detect certain errors at the time of compilation already. Using the type system, invariants can be declared in one's own data types, which are then checked by the compiler. Programming in and with a strong type system can be regarded as the first step in the direction of program verification. With even stronger type systems, it is possible to formulate complete program specifications. The compiler does then, however, generally require support for verification.

Correctness Choosing the right programming paradigm for a given problem simplifies its solution, but does not guarantee its correctness – the most important of all software qualities. Such a guarantee requires, in addition to the actual implementation (the "How?"), a specification (the "What?") and proof of correctness (the "Why?"). Continuous research right from the very outset of computing has now led to a verification technology that is entering industrial application. Since object-oriented programming is ubiquitous, its specification and verification is of particular importance.

This module will provide:

- an overview of programming concepts, paradigms and languages;
- a comprehensive introduction to functional programming (using Haskell or Scala);
- an introduction to multi-paradigm programming, with special emphasis on types (using Scala, which is a combination of functional and object-oriented programming);
- an introduction to the theory and practice of specification and verification of imperative programs (as a basis for the verification of object-oriented programs - example Dafny) and/or of functional programs (example Coq).

Aims, content, methods

Learning objectives and acquired competencies

Students will acquire an understanding of the emerging paradigms, practical skills in modern functional, multiparadigm and type-full programming, and a basic understanding of the increasingly important field of software specification and verification.

Contents of module with emphasis on teaching content

Functional programming (6 weeks)

- Programming concepts, paradigms and languages.
- Absence of state, referential transparency, reasoning about programs.
- Eager versus lazy evaluation.
- Types and type inference, higher-order functions, concrete data types and pattern matching.
- Functors, applicative functors, monads.
- An application: interpreter for a small imperative programming language (IML).

Multi-paradigm and strong typed programming (4 weeks)

- Trait types (and Mixin composition as a variant on classical inheritance).
- Generic types (co- and contravariance for type parameters).
- Type classes and implicit parameters.
- Type-secure DSLs (Domain Specific Languages).

Program verification (4 weeks)

- Reliability via testing and verification.
- Hoare logic and weakest preconditions.
- Architecture of verification tools.
- An application: verification condition generator.
- A current verification tool: Dafny and/or Coq.

Teaching and learning methods

- Ex-cathedra teaching.
- Programming and verification exercises.

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Bonnes connaissances opérationnelles de la programmation orientée objet.

Brève description du contenu et des objectifs

Au-delà de la programmation orientée-objets devenue une norme et du *testing* insuffisant, il existe tout un univers parallèle de technologies fascinantes. Ce module présente un panorama des diverses technologies émergentes du point de vue des langages de programmation.

Paradigmes Outre la programmation orientée objet qui est le paradigme de programmation le plus courant actuellement, d'autres *paradigmes* assez différents ont été amenés à maturité au cours des dernières décennies : en particulier la programmation *fonctionnelle*, la programmation logique ou encore la programmation par contraintes. Aucun de ces paradigmes (pas même la programmation orientée-objet) n'est adapté pour résoudre de manière optimale tous les types de problèmes, bien que chacun ait son domaine d'action où il peut faire valoir ses atouts. Toutefois, étant donné que

les logiciels modernes englobent souvent bon nombre de ces domaines, l'application simultanée de plusieurs paradigmes semble appropriée. En conséquence, il existe depuis peu des langages de programmation multi-paradigmes.

Typage Les langages de programmation disposant d'un système de typage riche et consistant permettent d'identifier certaines erreurs dès l'instant de la traduction. Le système de typage permet de déclarer des invariances dans des types de données, qui seront ensuite contrôlées par le compilateur. La programmation dans et à l'aide d'un système de typage fort peut être considéré comme un premier pas vers la vérification d'un programme.

Exactitude Le choix du bon paradigme de programmation permet de simplifier la solution de tout problème donné mais ne garantit pas son exactitude, la première de toutes les qualités d'un logiciel. Une telle garantie requiert, en plus de l'implémentation (le «comment»), une spécification (le «quoi») ainsi qu'une preuve d'exactitude (le «pourquoi»). Les recherches menées depuis les origines de la science informatique ont abouti à une technologie de la vérification qui entre désormais dans sa phase d'application industrielle. Etant donné que la programmation orientée objet est omniprésente, sa spécification et sa vérification revêtent une importance particulière.

Le module donnera:

- un aperçu des concepts et des paradigmes sous-tendant les langages de programmation;
- une introduction à la programmation fonctionnelle (à l'aide de Haskell ou Scala);
- une introduction à la programmation multiparadigmes, avec un accent particulier donné aux types (utilisant Scala, un langage alliant programmation fonctionnelle et programmation orientée objet);
- une introduction à la théorie et à la pratique de la spécification et la vérification des programmes impératifs comme base de la vérification de programmes orientés objet (à l'aide de Dafny et/ou Coq).

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants acquerront une vision des paradigmes émergents, des connaissances pratiques de la programmation fonctionnelle, type-full et multiparadigme, ainsi que les bases de la spécification et de la vérification, domaine en pleine expansion.

Contenu des modules avec pondération du contenu des cours

Programmation fonctionnelle (6 semaines)

- Concepts, paradigmes et langages de programmation
- Absence d'état, transparence référentielle, raisonnement à propos des programmes.
- Evaluation avancée ou retardée (*eager vs lazy*).
- Types et interférence du type.
- Fonctions de rang supérieur.
- Types de données concrètes et *pattern matching*.
- Une application : un interpréteur pour un petit langage de programmation impératif.

Programmation multiparadigmes et fortement typée (4 semaines)

- Les traits comme types (et composition Mixin comme variante à l'héritage traditionnel).
- Types génériques (covariance et contrevariance comme paramètres de typage).
- Classes de typage et paramètres implicites.
- Langages dédiés, DSL, (*Domain Specific Languages*) de typage sûr.

Vérification de programme (4 semaines)

- Fiabilité par les tests et la vérification.
- Logique de Hoare et calcul de plus faibles pré-conditions.
- Architecture des outils de vérification.
- Une application : générateur d'obligations de preuve VCG.
- Un outil de vérification actuel : Dafny et/ou Coq.

Méthodes d'enseignement et d'apprentissage

- Cours ex-cathedra.
- Exercices de programmation et de vérification.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

- Linear algebra and differential equations
- Feedback control systems
- Actuation and sensory systems
- Basic programming skills
- Basic robotics knowhow (recommended)

Brief course description of module objectives and content

In this module, basic and advanced robotics knowhow is developed necessary for leading-edge, innovative industrial and service applications with robot manipulators.

Aims, content, methods

Learning objectives and acquired competencies

At the end of this course, the student will have earned the knowledge necessary to build a complete robot system as well as acquired the skills to develop industrial and service applications based on commercial robots beyond their standard interfaces.

Contents of module with emphasis on teaching content

- **Robot Kinematics**
 - Homogeneous transformation matrices and quaternions
 - Forward, inverse and instantaneous kinematics of serial and parallel robots
 - Kinematic redundancies and subspaces
 - Trajectory generation
- **Robot Dynamics**
 - Motion state: speed, acceleration and jerk
 - Dynamic models of multibody systems
 - Modeling friction, gear backlash, efficiency and stiffness
 - Robot dynamic equations for simulation and control
- **Robot Control**
 - Linear and nonlinear control
 - Trajectory, force and hybrid control
 - Adaptive, model-based, vision-based control
 - Haptic control
- **Robot Design**
 - Task requirements and kinematic configuration
 - Joint types, actuators, sensors, communication busses and architectures
 - Control systems and real-time restrictions
- **Applications**
 - Industrial and service use cases
 - Collaborative and interactive robots
 - Research topics
 - Safety and ethics in robotics

Teaching and learning methods

- Ex-cathedra teaching
- Case studies
- Exercises
- The theory learned in class is applied in real robotic applications

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Basic calculus and linear algebra
- Basic knowledge in probability, statistical inference and regression analysis on the level of Devore, Farnum and Doi, "Applied Statistics for Engineers and Scientists", 2014 Cengage Learning.
- User knowledge of R, MATLAB, Python or any other statistical software.

Brief course description of module objectives and content

One of the most used (statistical) models for inferential data analysis is the linear regression model. But it is restricted to a Gaussian distributed response and a linear function for linking the linear combination of predictors with the expected response. Generalized Linear and Additive Models (GLM, GAM) allow us to relax some of these restrictions by specifying a more general set of response distributions and non-linear link functions. Hence we can analyse a wider variety of real world phenomenon such as counts, binary outcomes proportions and amounts (i.e. non-negative real-valued data). The aim of this modelling approach is to better understand the response outcome induced by the predictors based on the available data, allowing for better and more informed interpretation of the phenomenon. The first part of this course will provide an overview over the GLM/GAM approach and will detail many benefits and a few pitfalls.

The second part of this course covers the very popular and growing field of Bayesian statistics. We start with the fundamental principles of a Bayesian approach to the analysis of data that allows for a better accounting of uncertainty and more explicit statements of assumptions. We illustrate the basic mathematical framework as well as explanations of philosophy and interpretation. We set up and discuss introducing examples and extend them to more challenging modelling approaches, where we assess the outcome of a parameter in the face of uncertainty of other parameters. Completion of this part will give you an understanding and the ability to perform basic data analyses doing the Bayesian way.

Aims, content, methods

Learning objectives and acquired competencies

- The students are able to analyse data by Generalized Linear and Additive Models (GLM and GAM) and understand the benefits that these model approaches offer for the analysis of normally and non-normally distributed response variables.
- They also perceive the difference between a frequentist and a Bayesian modelling approach.
- The students acquire a comprehensive overview how the open source statistical environment R is used and are able to perform a data analysis applying the techniques introduced in the course on real data sets.

Contents of module with emphasis on teaching content

First Part (8 weeks):

- Review of the concepts of multiple linear regression analysis with respect to inference, prediction, model evaluation and variable selection. Introducing some advanced topics in linear regression modelling. (3 weeks)
- Extending the linear regression model to generalized linear and additive models including logistic, Poisson, and Gamma regression. Revise inference, evaluation and variable selection for such models. (5 weeks)

Second Part (6 weeks):

- Concepts of Bayesian statistics. Set up and make inference in a Bayesian model with specifying suitable prior distributions. (2 weeks)
- Making inference in a Bayesian framework by simulating from the model directly, via an exact approach and by applying MCMC-techniques, e.g. the Metropolis–Hastings sampling algorithm. (4 weeks)

The contents listed are illustrated with used cases from the industrial and scientific fields. The practical work is done with the open source statistical analysis environment R.

Teaching and learning methods

Classroom teaching and practical work on computer with the statistical analysis environment R.

Literature

Slides and lecture notes will be available in addition to recommended book chapters.

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Successful completion of a bachelor degree course on basic engineering thermodynamics

Brief course description of module objectives and content

In Part A this module reviews the subjects of basic engineering thermodynamics (energy, entropy and material balances, fluid properties, and important thermodynamic cycles) and extends knowledge to deal with real fluids, phase and chemical equilibria, system stability, and processes with chemical transformation.

Additionally, in Part B the students will learn to draw connections between detailed, thermodynamic formulae and full thermodynamic systems. The basic tools of thermodynamics (balances of conservative quantities) will be employed to model any complex, thermodynamic system. Selected examples will illustrate the utility of applying thermodynamics in various practical fields.

Aims, content, methods

Learning objectives and acquired competencies

Part A:

The achievement of the main goals in Part A is associated with the following competencies:

- Ability to set up and solve energy and entropy balances for open and closed thermodynamic systems.
- Ability to determine the properties of non-ideal gases and gas mixtures using corresponding states and/or a cubic equation of state.
- Understanding the Gibbs free energy and chemical potential and to be able to calculate conditions for thermal, phase and chemical equilibrium.

Part B:

- Intensify the understanding of some areas from Part A, by applying the gained knowledge in terms of model building of dynamic systems (e.g.: chemically reacting systems, irreversible levelling processes)
- Understand examples of how Advanced Thermodynamics is applied in practice (modeling of complex thermo-chemical processes, e.g. wood gasification, Richardson Ellingham diagram, analysis of cycle processes)

Contents of module with emphasis on teaching content

Part A:

Part A starts with a review of basic principles, conservation equations for mass, energy and entropy and their application. Important thermodynamic cycles are analyzed and the Gibbs Free Energy is introduced. The interrelations between thermodynamic variables are introduced and used as the basis for calculating deviations from ideal gas behavior using a cubic equation of state. The necessity for partial molar properties to describe real mixtures is shown and the chemical potential is introduced. Conditions for phase and chemical equilibrium are derived and employed in simple systems.

Weekly problem sets dealing with the topics are distributed and solutions discussed with the class.

Part B:

Part B starts with the repetition and consolidation of selected fields from part A by transferring the knowledge to application via modelling thermodynamic systems. Introducing and using a System Dynamic methodology (supported by the software Berkeley Madonna, to model interacting systems (e.g.: chemically reacting species, irreversible levelling), two goals are achieved:

- Students get a visualized impression of dependencies
- Students can connect detailed formulae with a large scale system overview.

As part B progresses, application examples from practice are presented:

- The structure of modern thermodynamic equilibrium solvers in the context of modelling complex thermo-chemical processes (e.g. wood gasification)
- The Richardson Ellingham, its connection to the learned content and its wide spread application within metallurgy
- Analysis of basic and more advanced cycle processes (e.g.: Diesel cycle, Stirling cycle)

The thermodynamic basics of chemical reactor engineering (heat-, mass balancing in tank- and tube reactors, reaction- and flame temperatures) are discussed as well.

Teaching and learning methods

Lectures with discussion, Interactive derivations on blackboard, supported by PPT slides, weekly problem sets with solutions. In Part A some exercises will be solved using Matlab and/or Excel software. In Part B exercises require the System Dynamic software Berkeley Madonna. Trial versions (sufficient for the course) available online for free.

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Avoir suivi avec succès le cours de niveau Bachelor en Thermodynamique de base

Brève description du contenu et des objectifs

Dans la partie A, le module revient sur les bases de l'ingénierie thermodynamique (les bilans d'énergie, d'entropie et de masse, les propriétés des fluides et les principaux cycles thermodynamiques) et élargit les connaissances pour aborder les fluides réels, l'équilibre entre phases et l'équilibre chimique, la stabilité des systèmes, et les processus de transformation chimique.

Ensuite, au cours de la partie B, les étudiants apprennent à établir des connexions entre des formules thermodynamiques détaillées et des systèmes thermodynamiques complets. Les outils fondamentaux de thermodynamique seront utilisés pour modéliser tout système thermodynamique complexe. Des exemples choisis viendront illustrer l'utilité de la thermodynamique dans différents domaines d'application pratiques.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Partie A:

La réalisation des principaux objectifs de la partie A est liée à l'acquisition des compétences suivantes :

- Être capable d'établir et de résoudre des bilans énergétiques et entropiques pour des systèmes thermodynamiques ouverts et fermés.
- Être en mesure de déterminer les propriétés des gaz et des mélanges gazeux non idéaux en utilisant la théorie des états correspondants et/ou une équation d'état cubique.
- Comprendre l'énergie libre de Gibbs et être capable de calculer les conditions d'équilibre thermique, entre phases et chimique.

Partie B:

- Approfondir la compréhension de certains domaines de la partie A en appliquant les connaissances acquises en termes de modélisation de systèmes.
- Comprendre les exemples montrant comment la thermodynamique avancée s'applique dans la pratique à la modélisation de processus thermomécaniques complexes (p. ex. machines trithermes à cycles avancés) et des processus réactifs (p. ex. installations de piles à combustible).

Contenu des modules avec pondération du contenu des cours

Partie A:

La partie A commence par une révision des principes fondamentaux, les équations de conservation de masse, d'énergie et d'entropie ainsi que leur application. Les principaux cycles thermodynamiques sont analysés et on introduit l'énergie libre de Gibbs. Les corrélations entre les variables thermodynamiques sont présentées et utilisées comme bases pour calculer les déviations d'un gaz par rapport au comportement idéal, à l'aide d'une équation cubique d'état. La nécessité d'utiliser des grandeurs molaires partielles pour décrire des mélanges réels est présentée et le potentiel chimique est introduit. Les conditions d'équilibre entre phases et d'équilibre chimique sont dérivées et ensuite utilisées dans des systèmes simples.

Des problèmes en lien avec les sujets abordés sont distribués chaque semaine aux étudiants et les solutions sont discutées en cours.

Partie B:

La partie B commence par une révision et une consolidation de thèmes choisis de la partie A passant par une mise en pratique des connaissances acquises avec d'une part les applications de mélange de fluides binaires non-réactifs dans les installations à processus thermomécaniques de chauffage, réfrigération et de production d'électricité et d'autre part les applications de mélange de fluides réactifs dans les systèmes thermochimiques de combustion et de piles à combustible.

L'introduction est une revue des systèmes thermomécaniques avancés à fluides binaires (p. ex : Le cycle de pompe à chaleur de Lorenz, les cycles à mélange de fluides organiques de Rankine), Ainsi:

- Les étudiants peuvent analyser et interpréter les différences par rapport aux cycles de base à fluides purs ;
- Les étudiants peuvent connecter des formules détaillées vues dans la partie A à une vue d'ensemble des systèmes à grande échelle.

Au fur et à mesure de la progression dans la partie B, les étudiants peuvent utiliser les diagrammes avancés pour résoudre des problèmes complexes en thermodynamiques:

- Le diagramme d'Ellingham, son rapport avec le contenu d'apprentissage et son vaste champ d'application au sein de la métallurgie;
- Les diagrammes de Oldham et de Merkel et ses applications dans les installations de machines à absorption, de transformateurs de chaleur et de machines à cycle de Kalina pour les installations géothermiques de production d'électricité.

En fin, les fondements thermodynamiques de l'ingénierie de la réaction chimique sont également abordés:

- Transferts thermiques et de masse dans les réacteurs tubulaires, températures de réaction et d'inflammation
- L'analyse des processus réactifs de base et plus avancés (p. ex.: Les processus de combustion pour les applications de moteurs à Gaz ou Diesel, les processus d'oxydo-réduction pour les applications de piles à combustible)

Méthodes d'enseignement et d'apprentissage

Cours avec discussion, dérivations interactives au tableau, à l'appui de diapositives PPT, présentations de problèmes chaque semaine avec solutions. Au cours de la partie A, certains exercices seront résolus en utilisant des feuilles Excel.

Brief course description of module objectives and content

Many data sets are temporal by nature. The course shows how to analyze time series of different domains and how to develop statistical models based on the data, in order to forecast future values or classify the time series into predefined categories. A probabilistic approach is emphasized, i.e. it is also discussed how to compute the uncertainty of the forecast which has been made.

The course adopts a practical approach: theoretical concepts are illustrated and applied in specific case studies. Students will also learn to identify the tools best suited for a given task.

The first part of the course presents techniques for analysis of time series. It starts from visualization techniques; then it shows techniques for characterizing trend and seasonality; eventually it presents structured statistical approaches based on exponential smoothing and ARIMA techniques. Several examples referring to real data sets are shown. The lab of this part are done using R.

In the second part of the course students learn how to analyze digital signals in different domains, i.e. time and spectral domain; they learn how to extract meaningful features from digital signals suitable for classification. Finally, they learn how to set up and learn statistical models, such as HMMs or DNNs, for recognizing and classifying time series. The lab of this part are done using Matlab.

Aims, content, methods

Learning objectives and acquired competencies

- Students know how to visualize time series and how to characterize their main features.
- Students know how to evaluate forecast accuracy.
- Students know how to model trends, seasonalities and non-stationarities adopting exponential smoothing and ARIMA models.
- Students know how to perform model estimation, model selection and probabilistic prediction with these models.
- Students know different methods to analyse digital signals in different domains
- Students know how to extract important features used in speech processing
- Students learn to apply Bayes rule for classifying digital signals.
- Students can apply modern deep learning approaches to classify digital signals

Contents of module with emphasis on teaching content

Part 1: Forecasting sequential data (7 weeks)

- Time series graphics.
- Main features of time series.
- Assessment of the predictions.
- Exponential smoothing
- ARIMA models

Practical case studies in R.

Part 2: Analysis and classification of digital signals (7 weeks)

- Analysis of digital signals in different domains (1 week)
- Feature extraction (1 week)
- Modelling, classification & recognition of digital signals (5 weeks)
 - Classic Approaches: Dynamic Time Warping, Vector Quantization
 - Statistical modelling: Hidden Markov Models
 - Deep Learning Approaches

Practical case studies in Matlab.

Teaching and learning methods

- Ex cathedra
- Self study of literature / publications
- Practical exercises with computer

Literature

Slides will be available covering the topics of the course.

In addition, recommended books are:

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

- Mathematics: basic linear algebra (e.g. matrix multiplications), probability theory (e.g. Bayes theorem)
- Statistics: basic descriptive statistics (e.g., mean, variance, hypothesis testing)
- Programming: good command of a structured programming language (e.g., Python, C++, Java, etc.)
- Machine learning: experimental framework, simple classifiers (e.g. decision trees, Naive Bayes, SVMs)

Brief course description of module objectives and content

This module introduces the main methods of text analysis using natural language processing (NLP) techniques, from a computer / data science perspective. The methods are introduced in relation to concrete applications, in order to extract meaningful, structured knowledge in several dimensions from large amounts of unstructured texts. The knowledge and applications are complementary to those of information retrieval, with several commonalities (e.g. document representation), and advanced IR topics will be included as well.

This module is divided into three parts, each of them starting with the description of one or more text analysis problems. Then, the main methods needed to address them are defined, emphasizing their generality and reusability. Finally, for each part, the methods are instantiated and combined to enable concrete applications.

The three parts are organized by increased sophistication of the analysis of language in texts:

- Text analysis using bags-of-words (i.e. texts are considered as sets of independent words)
- Text analysis using sequences of words
- Text analysis using sentence structure (i.e. considering also the dependencies between words)

Aims, content, methods

Learning objectives and acquired competencies

- The students are able to categorize a text analysis problem and relate the type of analysis that is required and the features to be extracted to a range of known problems.
- The students are able to identify text processing methods to leverage for solving a new problem.
- The students are aware of text processing tools and can adapt off-the-shelf systems to their needs.
- The students understand the role of data and evaluation metrics. Given a text analysis problem they are able to design comparative experiments to identify the most promising solution.

Contents of module with emphasis on teaching content

Introduction [5%]: importance of text analysis; layers of language analysis; basic text processing tools and notions of statistics; basic notions of information retrieval; data sources; evaluation methods; overview of the course.

Part A. Text analysis using bags-of-words [40%]

Motivating examples: text classification and sentiment analysis, need for word representations accounting for meaning and similarity, distributional semantics.

Methods for learning low-rank word representations from data with illustration of resulting vectors: topic models from LSA to LDA; word embeddings; word sense disambiguation (statistical vs. knowledge-based).

Apply low-rank word representations to text classification, sentiment analysis, information retrieval and content-based text recommendation using bag-of-words models.

Part B. Text analysis using sequences of words [20%]

Motivating examples: predict the next word in a sequence, POS tagging, named entity detection.

Methods and their applications: collocation extraction with mutual information, POS tagging with HMMs, NE detection with CRFs, language modeling with n-grams and neural networks.

Part C. Text analysis using sentence structure [20%]

Motivating example: natural language inference (reasoning over sentences).

Methods: parsing, semantic role labeling, named entity linking, relationship and fact extraction, neural network models of sentence structure (e.g. CNNs or HANs).

Applications: solving logical entailment with deep neural networks, revisiting sentiment analysis with DNNs, question answering system; automatic information extraction from texts (entities, relationships, facts, events) and linking with ontologies (e.g. DBpedia).

Part D. Special chapters [15%]

Perspectives on other text analysis tasks, on multilingual issues, question answering and dialogue, information retrieval and recommendation.

Teaching and learning methods

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Mathématiques: algèbre linéaire de base (p.ex. multiplication de matrices), notions de probabilités (p.ex. formule de Bayes)
- Statistiques: statistiques descriptives de base (p.ex. moyenne, variance, test d'hypothèse)
- Programmation: maîtrise d'un langage de programmation structurée (p.ex. Python, C++, Java, etc.)
- Apprentissage automatique (machine learning) : principes des expérimentations, classifieurs élémentaires (p.ex. arbres de décision, classifieur bayésien naïf, machines à vecteur support)

Brève description du contenu et des objectifs

Ce module présente les principales méthodes d'analyse des données textuelles, utilisant le traitement automatique des langues (TAL), dans la perspective de la science des données (data science). Les méthodes sont présentées en relation à des applications concrètes, pour extraire des connaissances sur plusieurs plans, à partir de grandes quantités de textes non-structurés. Ces connaissances et applications sont complémentaires à celles intervenant dans le domaine de la recherche d'information (RI), avec toutefois plusieurs points communs (p.ex. la représentation des documents) ; des notions avancées de RI seront également présentées.

Ce module est divisé en trois parties, chacune commençant par la présentation d'un ou plusieurs problèmes d'analyse des données textuelles. Puis, les principales méthodes requises pour résoudre ces problèmes sont définies, en mettant l'accent sur leur généralité et leur réutilisabilité. Enfin, pour chaque partie, les méthodes sont mise en œuvre et combinées en vue d'applications concrètes.

Les trois parties sont organisées par ordre croissant de la complexité des analyses textuelles utilisées :

- Analyse de textes utilisant des « sacs de mots » (les textes sont considérés comme des ensembles de mots indépendants)
- Analyse de textes utilisant les séquences (ordonnées) de mots
- Analyse de textes utilisant la structure des propositions (i.e. les relations entre mots)

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Les étudiants sont capables de classer un problème d'analyse de textes, d'identifier les analyses nécessaires et les traits à extraire, et de les relier à la gamme d'applications déjà étudiées.
- Les étudiants sont capables de choisir les méthodes de traitement automatique des langues à utiliser pour résoudre un problème nouveau.
- Les étudiants connaissent une gamme d'outils de TAL et peuvent adapter des systèmes génériques existants à leurs propres besoins.
- Les étudiants comprennent le rôle des données et des métriques d'évaluation. Etant donnée un problème d'analyse de textes, les étudiants

Contenu des modules avec pondération du contenu des cours

Introduction [5%]: importance de l'analyse des données textuelles ; niveaux d'analyse des langues ; outils fondamentaux ; rappels de statistiques et de recherche d'information ; sources de données ; méthodes d'évaluation ; vue d'ensemble du cours.

Partie A. Analyse de textes comme ensemble de mots [40%]

Motivation (exemples): classification de textes, analyse des sentiments ; nécessité de représenter les mots en tenant compte de leurs sens et leur similarité ; sémantique distributionnelle.

Méthodes: apprentissage de représentations de mots en dimensions réduites, illustration des vecteurs résultants : modèles de topics de la LSA à la LDA ; plongements de mots (embeddings) ; désambiguïsation du sens des mots (basée sur les statistiques ou sur les dictionnaires).

Application des représentations en dimensions réduites à la classification de textes, à l'analyse des sentiments, la recherche d'information, et la recommandation de textes basée sur le contenu (modèles « sacs de mots »).

Partie B. Analyse de textes utilisant les séquences de mots [20%]

Motivation (exemples): prédire le mot suivant dans une phrase, étiquetage morphosyntaxique, reconnaissance d'entités nommées.

Méthodes et applications: extraction de collocations un utilisant l'information mutuelle ; étiquetage morphosyntaxique avec des modèles de Markov cachés (HMM) ; reconnaissance d'entités nommées avec des CRFs ; modèles de langage à base de n-grammes ou de réseaux neuronaux.

Part C. Analyse de textes utilisant les structures des propositions [20%]

Motivation (exemples): capacité à faire des inférences à partir de phrases.

Méthodes: analyse syntaxique, étiquetage des rôles sémantiques, liage des entités nommées, extraction de faits et de relations, modèles neuronaux de la structure des propositions (p.ex. des réseaux de convolution, ou des réseaux hiérarchiques avec attention).

Applications: identification de l'implication logique ou analyse des sentiments avec des réseaux de neurones ; systèmes de question-réponse ; extraction d'information textuelle (entités, relations, faits, événements) et lien avec les ontologies (p.ex. DBpedia).

Part D. Morceaux choisis [15%]

Perspectives sur les autres tâches d'analyse de textes, le cas des données multilingues, le dialogue humain-machine, la recherche et la recommandation d'information.

Méthodes d'enseignement et d'apprentissage

Enseignement magistral, exercices utilisant la programmation

Brief course description of module objectives and content

Based on selected examples this modul imparts the scientific and technological basics as well as the possibilities and the perspectives of the micro- and nanotechnologies. The students should become sensitive to the enormous potential of applications of this field and acquire a certain ability in handling it.

Aims, content, methods

Learning objectives and acquired competencies

- the students know the the scientific and technological basics of this technology
- the students have a general understanding of the numerous fields of the micro- and nanotechnologies and their applications
- the students are able to combine the advantages of scaling and materials with the desired functions of the device.
- based on selected nanodevices the students develop the ability to apply specific nano properties

Contents of module with emphasis on teaching content

Introduction in the modern devcie fabrication

- scaling laws
- from photo- to nanolithography and self-assembling
- technologies for the material deposition and the surface structuring in order to result in certain electrical and other properties
- nanotools for the analysis and the modification of surfaces
- surface topography on micro- and nanolevel: AFM, SEM/TEM, IOM

Future technologies

- From MEMS to NEMS
- fullerene-based nanosystems
- biomedical applications of the nanotachnolgy
- micro- and nanofluidics
- nanosafety and risks

Brève description du contenu et des objectifs

A l'aide d'une sélection d'exemples bien choisis, ce module dispense aux étudiants les grandes lignes scientifiques et techniques ainsi que les possibilités et les perspectives offertes par les micro et nanotechnologies. L'objectif est de sensibiliser les étudiants à l'énorme potentiel de ce domaine et de leur communiquer une certaine aptitude à gérer ces technologies.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Les étudiants maîtrisent les grandes lignes scientifiques et techniques de ces technologies.
- Ils sont à même de comprendre de façon générale les nombreux domaines touchés par les micro et nanotechnologies et leurs applications possibles.
- Les étudiants savent allier les économies d'échelle et les propriétés des matériaux aux fonctions d'équipement souhaitées.
- Grâce à des nano-appareils soigneusement sélectionnés, ils développent la capacité d'appliquer certaines nanopropriétés spécifiques.

Contenu des modules avec pondération du contenu des cours

Introduction à la fabrication moderne d'appareils:

- Des règles d'échelles
- De la photolithographie à la nanolithographie et à l'auto-assemblage (self-assembly)
- Techniques de deposition des couches minces et de structuration de surface et d'ablation de matière visant à obtenir des propriétés électriques et autres.
- Nano-instruments pour l'analyse et la modification des surfaces
- Topographie des surfaces au niveau micro et nano: AFM, SEM/TEM, IOM

Technologies d'avenir

- Des MEMS aux nanosystèmes (NEMS)
- Nanosystèmes basés sur les fullerènes
- Applications biomédicales des nanotechnologies
- Micro et nanofluidique
- Nanosécurité et risques

Méthodes d'enseignement et d'apprentissage

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Optics: Basics of wave and geometrical optics;
without optics basics during bachelor studies, the EVA "Fundamentals of light" should be visited before visiting further TSM modules.
- Physics: Basics for engineers (bachelor niveau)
- Electronics: Basic analog electronics (bachelor niveau)

Brief course description of module objectives and content

Applied photonics offers an insight into various application areas of photonics, such as optoelectronics, waveguide optics, micro-optics and several application examples. Starting from the basic physics of light matter interaction, the module covers various topics of modern optoelectronics in the field of light detection systems and light sources. After an introduction to the basics of light guiding and the occurrence of fiber modes, loss and dispersion mechanisms in fibers are discussed. The module gives an overview of different types of fibers and shows the importance of single mode fibers, specialty fibers and integrated waveguides for modern photonic applications. Furthermore, microoptical components are introduced to emphasize their advantages for light shaping, beam guidance and fiber coupling. The module is rounded off by a selection of special applications such as optical telecom, fiber measurement and sensor technology, organic electronics, optical biosensors, smart lighting concepts or similar topics.

Aims, content, methods

Learning objectives and acquired competencies

After successfully completing this course the student

- understands the main principles of light matter interaction
- has a clear picture of the different types of semiconductor light sources and detectors used today
- knows how micro optics can be used to shape light in modern photonic systems
- knows the principles of light guiding in optical waveguides including losses and dispersion
- is familiar with different types of fibers and waveguides and their fields of applications
- knows how to select and apply sources, detectors, micro optics and fibers for designing photonic systems

Contents of module with emphasis on teaching content

1. Fundamentals of light-matter interaction (absorption, emission, scattering) (1 week)
2. Optoelectronics (4 weeks):
 1. detectors: photodiodes, photomultipliers, CCDs, CMOS sensors and dedicated electronic circuits
 2. sources: LEDs, SLEDs, OLEDs, laser diodes
3. Micro-optics: ROEs and DOEs (1 week)
4. Fibers & Waveguides (4 weeks):
 1. modes in planar waveguides and fibers, loss mechanisms and dispersion
 2. single mode fibers, specialty fibers and integrated waveguides
5. Photonic systems (4 weeks):
modern applications that illustrate the importance of optoelectronics, micro-optics and fiber optics like e.g. optical telecom, fiber metrology and sensing, organic electronics, optical biosensors, smart lighting concepts and many others more

Brief course description of module objectives and content

Mobile robots are complex mechatronic systems often interacting autonomously with their environment. The course combines theoretical foundations for coordinate transformations, sensor fusion, planning and control with examples in ROS. Tests of these complex systems can be conducted in simulated environments to speed up development and minimize risk of damage. Data from live tests can be recorded for later reuse and analysis as a foundation for further development.

Aims, content, methods

Learning objectives and acquired competencies

This course aims at giving students a deep insight into and theoretical understanding of the inner workings of autonomous mobile systems reinforced by hands-on experience of mobile robots or simulations thereof. At the end of this course students will be able to build mobile robots with autonomous behaviour.

Contents of module with emphasis on teaching content

- Mathematical foundations (short primer)
 - Coordinate transformations, quaternions
- Mobile robot platforms in different environments: air, land, sea
 - Wheeled robots, drones, submarines, ...
 - Kinematics
 - Typical sensors
 - Control
 - Real-time systems
- Localization
 - Odometry
 - GPS
 - Sensor fusion
- Mapping
 - SLAM
 - Closing the loop
- Navigation
 - Planning
 - Obstacle avoidance
 - Trajectory follower
- Advanced Topics
 - Real-time systems & Robot operating system frameworks
 - Multi-robot systems
 - Modelling and simplification (Simulation & Design)
 - Dynamics of mobile robot platforms

Teaching and learning methods

Ex-cathedra teaching

Case studies

Prerequisites, previous knowledge

- Basic knowledge of control engineering and machines (Bachelor degree level)
- Mastery of *Matlab* and *Simulink*
- Possession of a laptop with *Matlab /Simulink* installed

Brief course description of module objectives and content

This module treats methods of concept, dimensioning and development in the servo drive technology sector which are particularly compatible with the various industries.

Aims, content, methods

Learning objectives and acquired competencies

After the completion of this module, students will be able to:

- analyze the dynamics of a drive,
- quantify or even improve its dynamic behavior, and
- integrate a drive into a mechatronic system.

Contents of module with emphasis on teaching content

Electric motor drives (DC, synchronous, asynchronous, stepper, reluctance, and piezoelectric motors), pneumatic drives, hydraulic drives
Actuator selection from the energy source to the mechanical process: modeling, dimensioning, alignment
Selection of case studies from the industrial sector

Preface for documentation: <http://moodle.msengineering.ch/course/view.php?id=35>

Content

Presentations, description of module, organization

Introduction on drives

Evaluation: development of model on Matlab/Simulink for a drive, and simulation.

Variants on drive solutions.

Drive solutions with DC or BLDC motors

- dynamic description of movement

- modeling (*Matlab+Simulink*)

- transmitters and power electronics

- transmissions

- cascade regulation of drives.

- synchronous motor

- asynchronous motor

- stepper motor

- reluctance motor

Several case studies from the industrial sector: multiaxial drives, robotics, medical, railway, automotive, ...

Teaching and learning methods

- Ex-cathedra teaching
- Case studies
- Exercises (*Matlab*)

Compétences préalables

Connaissances préalables, compétences initiales

- Connaissances de base de réglage automatique et de machines au niveau bachelor.
- Maîtrise de base de MATLAB et Simulink.
- PC portable équipé de MATLAB /Simulink, version étudiants

Brève description du contenu et des objectifs

Ce module apporte des méthodes de conception, de dimensionnement et de développement d'entraînements réglés dans le domaine des entraînements automatiques, particulièrement adaptées aux diverses applications industrielles.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

A l'issue de ce module, les étudiants seront capables de :

- analyser le comportement dynamique d'un entraînement réglé.
- développer, dimensionner et configurer un système d'entraînement.
- d'intégrer un asservissement dans un système mécatronique.

Contenu des modules avec pondération du contenu des cours

Entraînements à moteurs électriques (DC, BLDC, synchrones, asynchrones, réductants, pas-à-pas).

Conception de l'entraînement depuis la source d'énergie jusqu'au processus mécanique : modélisation, dimensionnement, ajustage.

Sélection d'exemples issus des domaines industriels.

Préface de la documentation: <http://moodle.msengineering.ch/course/view.php?id=35>

Contenu
Présentation, description du module, organisation, évaluation.
Introduction aux systèmes d'entraînement.
Evaluation : développement d'un modèle avec Matlab/Simulink pour un système d'entraînement et simulation.
Variantes de solutions d'entraînements.
Concepts d'entraînements avec un moteur DC ou BLDC
- Description dynamique des mouvements
- Modélisation (Matlab+Simulink)
- Capteurs et électronique de puissance
- Réducteur
- Réglage cascade de systèmes d'entraînement
- Moteur synchrone
- Moteur asynchrone
- Moteur pas-à-pas, moteur réductant
Etude de quelques cas, choix d'exemples industriels : machines textiles, d'emballage et d'imprimerie, machines-outils, automobile, navigation, chemins de fer, robotique, appareils médicaux, ...

Méthodes d'enseignement et d'apprentissage

- Enseignement frontal
- Etudes de cas
- Exercices (MATLAB)

Lektionen

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Bachelor-Abschluss in einer technischen Fachdisziplin, Business Engineering, Informatik o.ä. Erste Kontakte mit der BIM-Methode von Vorteil. Es sind keine CAD-Kenntnisse erforderlich.

Kurzbeschreibung der Inhalte und Ziele

Die BIM-Methode (VDC) umfasst das digitale Planen, Bauen und Betreiben von Bauwerken mit digitalen Bauwerksmodellen in Kombination von geeigneten Organisationsformen und Prozessen.

Das digitale Bauwerksmodell wird dabei zielgerichtet und disziplinübergreifend erstellt. Es umfasst sowohl die geometrischen (3D) wie die nichtgeometrischen Informationen die es zur Nutzung der vereinbarten Anwendungsfälle braucht.

Die BIM-Methode findet sowohl im Bauwesen bei der Projektierung und Realisierung (z.B. Grundlagen [rechtlich, geologisch/geotechnisch], Architektur, Ingenieurwesen, Haustechnik), in der Geomatik für die Bauwerksgeometrierfassung, -modellierung, -nachführung und -verwaltung als auch im Facility Management Anwendung.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Im TSM_BIM lernen die Studierenden die wichtigsten Grundlagen der BIM-Methode kennen. Dabei werden sowohl bau- (BIM) wie geomatik-relevante (GeoBIM) Aspekte betrachtet.

Fokus des Moduls liegt in der disziplinübergreifenden Nutzung von digitalen Bauwerksmodellen.

Die Studierenden sind nach dem Besuch des TSM_BIM Moduls in der Lage Informationsanforderungen an einfache digitale Bauwerksmodelle zu formulieren und zu erfassen, deren Daten im offenen Datenaustauschformat IFC auszutauschen und anschliessend zielgerichtet zur Gewinnung von Informationen auszuwerten.

Der Unterricht erfolgt praxisnah unter der Nutzung von digitalen Bauwerksmodellen und geeigneten BIM-Werkzeugen.

Modulinhalt mit Gewichtung der Lehrinhalte

TEIL 1: BIM-Methode – Grundlagen und Blick in die Praxis

Einführung: Definition und Grundidee. Planungs- und Bauprozess gestern, heute und morgen. Stand BIM CH-International. Terminologien. Herausforderungen.

Anspruchsgruppen, Modelle und Rollen: Vom Auftraggeber über die Planer bis hin zu Betreiber und Nutzer. Prinzip der Informationsanforderungen und -lieferung. Informationsbesteller / Informationssender.

Blick in die Praxis: Anforderungen, Strukturierung, Aufbau und Auswertung von digitalen Bauwerksmodellen.

Daten und Digitale Bauwerksmodelle: Lesen und beurteilen von Daten aus digitalen Bauwerksmodellen.

TEIL 2: GeoBIM und Datenaustauschmodelle

BIM und Geodaten: Unterschiede und Gemeinsamkeiten zwischen BIM und Geo, 3D-Modellierungsparadigmen.

Datenaustauschmodell IFC: IFC-Schema, IFC vs. CityGML.

Software der BIM-Methode und Geodatenerfassung für BIM (Field2BIM): BIM-Software und -Webplattformen, BIM-Webdienste, 3D-Erfassungstechnologien und Points2BIM-Konzepte.

TEIL 3: Digitale Bauwerksmodelle und Datenmanagement

Informationsanforderungen: Formulierung von BIM-Zielen, Lastenheft (EIR). Beschreibung und Prüfung von Informationsanforderungen.

Datenauswertung I: Gewinnen von Informationen durch das vordefinierte Auswerten von digitalen Bauwerksmodellen. Prüfen der Datenqualität.

Erweiterung Datenaustauschmodell I: Nutzung eines Autorenwerkzeuges. Erweitern des nativen Datenmodelles.

Erweiterung Datenaustauschmodell II : Nutzung eines Autorenwerkzeuges. Mapping des nativen Datenmodelles auf das IFC-Datenaustauschmodell.

Datenauswertung II: Formulieren und Schreiben von Regeln zur Gewinnung von Informationen aus digitalen Bauwerksmodellen.

Datenauswertung III: Zielgerichtete Ausgabe von Informationen aus digitalen Bauwerksmodellen in Templates zur weiteren Verarbeitung.

BIM-Projektentwicklungsplan: Der BIM-Projektentwicklungsplan als Pflichtenheft das Aufbau, Struktur, Qualitätssicherung und Datenaustausch regelt.

Lehr- und Lernmethoden

Vorlesung, Fallbeispiele, Übungen, ggf. Exkursion

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Diplôme Bachelor dans une discipline technique spécialisée, Business Engineering, Informatique, ou similaire; des premiers contacts avec la méthode BIM constitueraient un atout. Les connaissances en CAD ne sont pas nécessaires.

Brève description du contenu et des objectifs

La méthode BIM (VDC) comprend la planification, la construction et l'exploitation informatisée d'ouvrages à l'aide de maquettes numériques combinée à des formes d'organisation et des processus adaptés.

La maquette numérique est ainsi réalisée conformément à la finalité et en collaboration multidisciplinaire. Elle regroupe les informations géométriques (3D) et non géométriques nécessaires aux applications définies pour l'usage de l'ouvrage.

La méthode BIM est appliquée tant

- dans le domaine de la construction lors de la mise en projet et de la réalisation (p.ex.: fondements [juridiques, géologiques/géotechniques], architecture, ingénierie, technique du bâtiment) ;
- en géomatique pour le relevé, la modélisation, la réalisation et la gestion de la géométrie d'ouvrage ;
- pour le Facility Management.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Au cours du module TSM_BIM, les étudiant-e-s se familiarisent avec les grands principes de la méthode BIM. Tant les aspects de construction (BIM) que de géomatique (GeoBIM) seront abordés.

L'objectif du module se concentre sur l'utilisation interdisciplinaire des maquettes d'ouvrages digitalisés.

Les étudiant-e-s ayant suivi le module TSM_BIM sont en mesure de formuler et de saisir des exigences en termes d'information sur des maquettes d'ouvrages simples puis de les évaluer de manière ciblée en vue d'obtenir des informations.

Le cours est orienté pratique par le biais de l'utilisation de maquettes d'ouvrages numériques et d'outils BIM adaptés

Contenu des modules avec pondération du contenu des cours

PARTIE 1: Méthode BIM– Bases et aperçu de la pratique

Introduction Définition et idée fondamentale. Processus de planification et de construction d'hier, d'aujourd'hui et de demain. Statut BIM CH-International. Terminologies. Défis.

Groupes d'exigences, modèles et rôles: Du donneur d'ordre aux exploitants et utilisateurs en passant par les bureaux d'étude. Principe des exigences et de la transmission d'informations. Demandeur / émetteur d'informations.

Aperçu de la pratique: Exigences, structure, cadre et évaluation des maquettes d'ouvrages numériques.

Donnes et maquettes d'ouvrages numériques: Lecture et évaluation de données à partir de maquettes d'ouvrages numériques.

PARTIE 2: Modèles d'échange de données et GeoBIM

BIM et géodonnées: Différences et points communs entre les paradigmes de modélisation 3D BIM et Geo.

Modèle d'échange de données IFC: Schéma IFC, IFC vs. CityGML.

Logiciels de la méthode BIM et saisie de géodonnées pour BIM (Field2BIM): Logiciels et plateforme internet BIM, services web BIM, technologies de saisie 3D et concepts Points2BIM.

PARTIE 3: Maquettes d'ouvrages numérique et gestion des données

Exigences d'information: Formulation d'objectifs BIM et cahier des charges (EIR). Description et vérification des exigences relatives à l'information.

Evaluation des données I: Acquisition d'informations par une évaluation prédéfinie de maquettes d'ouvrages numériques. Vérification de la qualité des données.

Élargissement du modèle d'échange de données I: Utilisation d'un outil auteur. Élargissement du modèle de données natif.

Élargissement du modèle d'échange de données II: Utilisation d'un outil auteur. Mapping du modèle de données natif sur le modèle d'échange de données.

Évaluation des données II: Formulation et rédaction de règles pour l'obtention d'informations à partir de maquettes d'ouvrages numériques.

Évaluation des données III: Édition ciblée d'informations à partir de maquettes d'ouvrages numériques dans des modèles en vue de leur traitement ultérieur.

Plan de déroulement de projet BIM: Le plan de déroulement de projet BIM en guise de cahier des charges qui régit le cadre, la structure et l'assurance qualité ainsi que l'échange des données.

Méthodes d'enseignement et d'apprentissage

Enseignement frontal- cours; études de cas, exercices; éventuellement excursions

Grundlagen der Baustatik, des Stahlbaus und des Stahlbetonbaus

Kurzbeschreibung der Inhalte und Ziele

Ziel des Moduls ist, durch die Erweiterung des im Bachelorstudium angeeigneten Wissens ein vertieftes Verständnis über das Tragverhalten schlanker Stabstrukturen zu erlangen.

Im Modul werden verschiedene Tragwirkungen vor allem schlanker und elastischer Stäbe behandelt. Speziellere Beanspruchungen wie Querkraftschub und Torsion, inkl. Wölbkrafttorsion werden vertieft behandelt. Weiterhin wird das Tragverhalten besonderer schlanker Stabkonstruktionen, wie z.B. Seile und Bögen vertieft. Einen grossen Teil wird ausserdem die Stabilitätstheorie einnehmen, in dem mit analytischen und numerischen Methoden Verzweigungsprobleme gelöst und Berechnungen nach Theorie II. Ordnung durchgeführt werden.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Einfache Tragwirkungen: Stabdehnung, Schubträger, Berechnung von Querkraftschub, Torsion (Umlauf- und Wölbkrafttorsion), Biegeträger, Seile (Berechnung biegeweicher Tragwerke), Bogen und Ringe.

Kombinierte Tragwirkungen: Timoshenko-Balken als Schub-/Biegeträger der im Gegensatz zum Bernoulli-Träger über keine ebenbleibenden Querschnitte verfügt, Schub- und Biegeträger, Biegung und Normalkraft, Seilwirkung und Biegung.

Stabilitätstheorie: Stabilitätsprobleme Biegeknicke und Biegedrillknicken, Allgemeine Lösung von Eigenwertproblemen mit der Gleichgewichts- und der Energiemethode, Analytische und numerische Berechnung von kritischen Lasten, Ermittlung und Beurteilung von Knickbiegelinien und Knicklängen, Berechnungen mit der Spannungstheorie II. Ordnung für Biegung und Normalkraft.

Modulinhalt mit Gewichtung der Lehrinhalte

- Teil 1 -- Einfache und kombinierte Tragwirkungen: 2/3
- Teil 2 -- Stabilitätstheorie: 1/3

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic knowledge in anatomy, functional anatomy and pathology (fracture, neuro, orthopaedics, osteosynthesis)

Brief course description of module objectives and content

(1) The aim of this module is to obtain a deeper understanding of the human musculoskeletal system, its function and biomechanical analysis, pathologies and possible treatment strategies in surgery and rehabilitation.

(2) Participants will obtain insight into basic requirements such as biology and physiology, materials used for implants and prostheses and available biomaterials for skeletal tissue regeneration.

(3) Current clinical topics such as osteoporosis, fracture fixation osteoarthritis and neurorehabilitation are addressed. Treatment methods such as fracture fixation, primary stability and joint replacements are discussed.

(4) A deeper insight is provided into technologies for human motion analysis (measurement technologies and performance analysis).

(5) The course will also discuss robot-assistive rehabilitation technologies in cases of neuropathology such as stroke, multiple sclerosis and spinal cord injury.

Aims, content, methods

Learning objectives and acquired competencies

There will be two main subjects: a) prosthetics as well as b) current clinical topics. The students will learn more about these subjects and will understand why they are particularly important in the field of medical engineering.

Contents of module with emphasis on teaching content

Prosthetics

- human movement analysis, orthopedics, biomechanics, biomaterials
- biomechanical testing of implants / test development & lab accreditation

Current clinical topics

- aging and geriatrics, degenerative diseases, osteoporosis, muscle atrophy, neuro- / endocrinological disorders (e.g. diabetes mellitus)
- bioreactors and tissue engineering in regenerative medicine

Teaching and learning methods

There will be a mix of various teaching methods applied like classical teaching, group work, flipped classroom, blended learning etc.

Literature

Slides and lecture notes will be made available to the students. Furthermore, there will be a list provided with references to books or scientific articles relevant to the topics taught.

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Kenntnisse in Baustatik, Materialtechnologie

Kurzbeschreibung der Inhalte und Ziele

Ein grosser Teil der zukünftigen Bauaufgaben wird an bestehender Bausubstanz durchgeführt werden. Dieses Modul vermittelt dem Masterstudierenden die grundlegenden Methoden und Verfahren zur Erhaltung von Bauwerken.

Die Zustandserfassung mit einer fachlich fundierten Beurteilung ist Grundlage jeder Instandsetzung und ggf. Veränderung von Bauwerken und Infrastrukturanlagen. Die Auseinandersetzung mit bestehenden Tragsystemen, das Erkennen von konstruktiven Zusammenhängen sowie die Beurteilung der aktuellen Tragfähigkeit sind Schwerpunkte der Ausbildung. Anhand von Beispielen aus dem Stahlbeton-, Stahl- und Holzbau lernen die Studierenden die Methodik und die Spezialitäten kennen.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Die Studierenden erwerben grundlegende Kompetenzen in der Zustandserfassung und Überprüfung von bestehenden Bauwerken. Hierzu werden in den Vorlesungslektionen die Aufgaben und Anforderungen an die Zustandserfassung vermittelt und der notwendige Detaillierungsgrad diskutiert. Der Umfang und Ablauf einer Überprüfung werden in Übungslektionen eingeübt

Die Studierenden lernen die gängigsten (zerstörungsfreie und nicht zerstörungsfreie) Untersuchungsmethoden für die Baustoffe Stahlbeton, Stahl und Holz kennen und diese zielgerichtet baupraktisch einzusetzen. Sie erhalten in den Vorlesungslektionen Informationen über deren Einsatzgebiete und lernen deren Anwendungsgrenzen kennen.

Die Studierenden werden für die wesentlichsten Schädigungsmechanismen und Mängel der gängigsten Stahlbeton-, Stahl- und Holzkonstruktionen sensibilisiert und erwerben Kenntnisse in der statischen Überprüfung und Modellierung von bestehenden Bauwerken. Auf dieses Ziel wird in den Vorlesungslektionen hingearbeitet und in weiteren Übungslektionen vertieft.

Die Studierenden erhalten Wissen über die gängigsten Instandsetzungsverfahren. Diese werden anhand von baupraktischen Beispielen vermittelt. In den Übungsbeispielen wird das erworbene Wissen vertieft.

Modulinhalt mit Gewichtung der Lehrinhalte

Das Modul gliedert sich in vier Teile:

1. Grundlagen (ca. 10%)

Wesen und Aufgabe der Zustandserfassung / Überprüfung von Bauwerken Anforderungen an eine Zustandsanalyse, Detaillierungsgrad

Ablauf einer Zustandserfassung / Überprüfung (Vorbereitung, Durchführung, Auswertung, Beurteilung)

2. Stahlbetonbau (ca. 60%)

Mängel, Schadenbilder, Schadenursachen, Schadensmechanismen, Schadensausmass zerstörungsfreie und zerstörende Untersuchungsmethoden

Auswertung und Beurteilung Tragsicherheitsanalyse und -beurteilung Instandsetzungs- und Verstärkungsmassnahmen

3. Holzbau (ca. 15%)

Mängel, Schadenbilder, Schadenursachen, Schadensmechanismen, Schadensausmass zerstörungsfreie und zerstörende Untersuchungsmethoden

Auswertung und Beurteilung

Instandsetzungs- und Verstärkungsmassnahmen

4. Stahlbau (ca. 15%)

Mängel, Schadenbilder, Schadenursachen, Schadensmechanismen, Schadensausmass zerstörungsfreie und zerstörende Untersuchungsmethoden

Auswertung und Beurteilung

Instandsetzungs- und Verstärkungsmassnahmen

Lehr- und Lernmethoden

- Frontalunterricht
- Diskussion praktischer Beispiele
- Übungen und Selbststudium ausgewählter Themen

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Basic knowledge in statistics on the level of an introductory stochastics course.

Brief course description of module objectives and content

Business Analytics (BA) is the science of analyzing enterprise data with statistical methods. The aim is to better understand market, customers, internal processes and the competitive environment, allowing for better and more informed decisions in business. As such, BA goes well beyond simply presenting data, numbers and tables, but focuses on finding new patterns, explaining the occurrence of results and forecasting future development. The essence is to find meaning in the data and successfully deploy it into the daily business life. This course will provide an overview over the principal questions, practices, methods, tools and goals in BA.

Aims, content, methods

Learning objectives and acquired competencies

The students understand the benefits that BA offers for an enterprise, i.e. they perceive the potential that quantitative analysis of business data harbors and that it is important to turn data into information. They acquire a comprehensive overview how and in which fields BA can offer added value to a company. The students are able to perform basic tasks in e.g. customer selection, segmentation, demand forecasting and maintenance planning on their own means. They recognize points of contact to other, technical modules such as Predictive Modelling and can strengthen their skills in statistical data analysis.

Contents of module with emphasis on teaching content

Throughout the course, there will be a strong focus on the process of gaining information from and making use of business data. That involves setting realistic goals, selecting suitable data, drawing unbiased conclusions, reporting facts correctly and deploying the results. This goes along with pointing out some common misconceptions and pitfalls that often repeat themselves in statistical analysis.

The meat of the course will be made up by case studies that cover BA tasks such as customer segmentation, churn analysis, customer selection, demand forecasting, point-of-sale data, customer lifetime value, dynamic pricing, planned maintenance, service science, et cetera. The use and benefits of each of these topics will be explained, methods for practically solving the analysis tasks will be presented in an accessible, non-technical manner and focus on the validity and generalizability of the results will be laid.

Teaching and learning methods

Lectures and practical work on computer with suitable BA tools.

Literature

Slides and lecture notes will be available in addition to recommended book chapters.

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Knowledge of fluid mechanics: laminar, turbulent, compressible, incompressible, steady-state and non-steady-state flow
- Knowledge of thermodynamics: conservation of mass and energy, equation of state (ideal gas, incompressible fluid), heat capacity, thermal conductivity
- Basic knowledge of numerical methods
- Basic knowledge of CFD simulation methods and tools is desirable

Brief course description of module objectives and content

This module provides students with an introduction to CFD by imparting knowledge of state-of-the-art techniques in computational fluid dynamics, with the emphasis on fluid physics and verification/assessment.

Aims, content, methods

Learning objectives and acquired competencies

Students who have completed this module are able to:

- understand the potential of computational fluid dynamics for product development and be aware of its limits
- verify simulation results and critically assess simulation models
- understand the properties of the numerics behind the code

Contents of module with emphasis on teaching content

- **Motivation:** objectives of computational fluid dynamics, meaning and economic benefit of numerical simulation, integration of numerical simulation in product development, possibilities and limits
- **Introduction to physical and technical systems and their describing equations:** fluid mechanics, thermodynamics, others
- **Idealization and modeling:** classification of the simulation tasks (steady-state, transition, 2D, 3D, symmetry, etc.), modeling based on geometry, flow properties, boundary conditions
- **Verification and assessment:** solving equations correctly, solving the correct equations, interpretation of simulation results, error possibilities and sources

Teaching and learning methods

Ex cathedra, practical exercises and case studies

Literature

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Very good knowledge of mechanics and strength analysis
- Knowledge of numerical methods
- Basic knowledge of simulation methods such as FEM

Brief course description of module objectives and content

The module provides students with comprehensive knowledge in the numerical simulation of demanding static and dynamic problems in structural mechanics. Special emphasis is placed on validation methods for the models and verification possibilities for the results.

Aims, content, methods

Learning objectives and acquired competencies

After completing this module, students will be able

- to apply in-depth knowledge of the theory of the finite element method in practice;
- to approach simulation tasks systematically;
- to exploit the possibilities of numerical simulations for structural-mechanical problems in product development, but also to know their limits;
- to verify simulation results and to validate simulation models;
- to assess the importance of nonlinear effects and to consider them in nonlinear simulations;
- to set up and carry out dynamic simulations.

Contents of module with emphasis on teaching content

- **Introduction:** sophisticated numerical simulation in product development, meaning, possibilities and limits
- **Theory of the finite element method:** method of the weighted residual, principle of virtual work, discretization, approach functions and element classes, numerical integration, assembling of the equation system
- **Idealization and modeling:** classification of simulation tasks (static, dynamic, linear, nonlinear, stationary, transient, 2D, 3D, symmetry, etc.), selection of correct elements, material properties, boundary conditions, loads, equation solution
- **Verification and validation:** correct solving of correct equations, interpretation of simulation results, possible errors and error sources
- **Nonlinearities:** geometric nonlinearities, stability problems, nonlinearity of materials (material models), contact problems and their modelling
- **Dynamics:** eigenfrequency analysis, direct time integration (explicit and implicit), modal superposition, response analyses

Week	Topic
1	Introduction to numerical simulation and methods
2	Theory of FEM
3	Theory of FEM
4	Idealizations in structural mechanics
5	Modelling and solution methods
6	Interpretation, verification and validation
7	Introduction to nonlinear FE simulations
8	Geometric nonlinearities and contacts
9	Stability problems (buckling, etc.)
10	Nonlinear material models
11	Nonlinear material models
12	Natural frequency analysis, modal analysis
13	Direct explicit and implicit time integration, damping
14	Modal superposition, response analysis in the frequency domain

The module is divided into 3 courses.

Course	Title	Week
1	Theory of the Finite Element Method	1-6
2	Nonlinear structural mechanics	7-11
3	Structural dynamics	12-14

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Très bonnes connaissances en mécanique des structures et résistance des matériaux
- Connaissances des méthodes numériques
- Connaissances de base des méthodes de simulation telle que la simulation FEM

Brève description du contenu et des objectifs

Le module transmet aux étudiants des connaissances étendues en simulation numérique de problèmes statiques et dynamiques avancés de la mécanique des structures. Une importance particulière est attachée à la validation des modèles de simulation et aux possibilités de vérification des résultats.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Une fois ce module achevé, les étudiants seront capables

- d'appliquer en pratique la théorie de la méthode des éléments finis;
- d'aborder de manière systématique des problèmes de simulation numérique;
- d'exploiter, dans le cadre du développement de produits, le potentiel de la simulation numérique pour les problèmes de mécanique des structures, mais aussi d'en connaître les limitations;
- de valider un modèle de simulation et de vérifier les résultats obtenus;
- d'évaluer l'influence d'effets non-linéaires et d'en tenir compte dans le cadre de simulations non-linéaires;
- d'effectuer des simulations dynamiques.

Contenu des modules avec pondération du contenu des cours

- **Introduction:** simulation numérique avancée dans le développement de produits, importance, possibilités et limitations
- **Théorie de la méthode des éléments finis:** méthode des résidus pondérés, principe du travail virtuel, discrétisation, fonctions d'interpolation et classes d'éléments, intégration numérique, mise en place du système d'équations
- **Modélisation:** classification des types de simulation (statique, dynamique, linéaire, non-linéaire, stationnaire, non-stationnaire, 2D, 3D, symétrique, etc.), sélection des éléments appropriés, propriétés des matériaux, conditions limites, charges, résolution des équations
- **Vérification et validation:** résolution des équations, interprétation des résultats de la simulation, connaissance des erreurs possibles et des sources d'erreurs
- **Non-linéarités:** non-linéarités géométriques, problèmes de stabilité, non-linéarité du comportement des matériaux (modèles constitutifs de matériaux), problèmes de contact et leur modélisation
- **Dynamique:** analyse modale, intégration temporelle directe (explicite et implicite), superposition modale, analyses de réponse en fréquence

Semaine	Thème
1	Introduction à la simulation et aux méthodes numériques
2	Théorie de la méthode des éléments finis (FEM)
3	Théorie de la méthode des éléments finis (FEM)
4	Modélisation en mécanique des structures
5	Modélisation et procédés de résolution
6	Interprétation des résultats, vérification et validation
7	Introduction aux simulations FEM non-linéaires
8	Non-linéarités géométriques et contacts
9	Problèmes de stabilité (flambage, voilement, etc.)
10	Modèles de matériaux non-linéaires
11	Modèles de matériaux non-linéaires
12	Analyse modale, détermination des fréquences propres
13	Intégration temporelle directe (explicite et implicite, amortissement)
14	Superposition modale, analyse de réponse en fréquence

Le module est subdivisé en 3 cours.

Cours	Désignation	Semaine
1	Théorie de la méthode des éléments finis	1-6
2	Mécanique des structures non-linéaires	7-11
3	Dynamique des structures	12-14

Méthodes d'enseignement et d'apprentissage

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic understanding of software and systems engineering, basic usage of Linux, communication technologies/networking.

Brief course description of module objectives and content

Lecture on advanced topics in the domain of Cloud Computing, more precisely covering use, operations, development of and for IaaS and PaaS, as well as developing applications natively for the cloud.

Aims, content, methods

Learning objectives and acquired competencies

Conceptual understanding of the principles and architectural design of IaaS and PaaS services, as well as concrete implementations/frameworks.
Ability to operate and use IaaS-frameworks. Ability to operate and use PaaS-frameworks.
Understanding of IaaS and PaaS management APIs.
Ability to design services and service-oriented applications natively for the cloud.
Ability to leverage features of the cloud, that is on-demand, self-service, elasticity, multi-tenancy, metered service, broadband network access.
Ability to evaluate the economic, legal and technological advantages of cloud as well as inherent limitations.

Contents of module with emphasis on teaching content

- Definition, Origin and Motivation, Principles, Services (IaaS, PaaS, SaaS) and Deployment Models (Public, Private, Hybrid)
- IaaS - Successful commercial example: Amazon Web Services (AWS)
- IaaS - OSS Alternative: Kubernetes, Architecture, Services, Usage
- IaaS - Compute Virtualization - Hypervisors and Containers
- IaaS - Storage Virtualization - Basic Concepts, Block, File and Object Storage Services
- IaaS - Network Virtualization - Software Defined Networking
- Cloud Security
- PaaS - OSS Alternative: CloudFoundry, Architecture, Services, Usage
- PaaS - Continuous Deployment
- PaaS - Cloud-native Application Design Principles
- FaaS - Function as a Service / Serverless Computing

Teaching and learning methods

2 Lectures, 1 tutorial session per week
Self-study based on lecture material and literature (papers, books)

Compréhension de l'ingénierie logicielle et des réseaux, usage basique de Linux, technologies de communication/networking

Brève description du contenu et des objectifs

Ce cours est une introduction aux technologies liées au Cloud et à la containerisation. Il permet à l'étudiant de découvrir et pratiquer les environnements et technologies, propriétaires et open-source, liées au Cloud.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Understand the concepts, principles and architectures of IaaS, PaaS and FaaS services, as well as deployment and implementation environments.
- Be able to use and choose the appropriate IaaS, PaaS and FaaS Cloud environments
- Understand the APIs allowing access to IaaS and PaaS services.
- Be able to choose appropriate measures to secure a Cloud.
- Be able to design "cloud-native" services and applications.
- Be able to use the characteristics of the cloud: on-demand resources, elasticity, multi-user, metered services, broadband network access.
- Be able to evaluate the economic, legal and technological advantages/limits of the cloud as well as its intrinsic limitations.

Contenu des modules avec pondération du contenu des cours

- Definition, principles, services and deployment models (1 session)
- Comparative study of different infrastructure services (IaaS), including storage (2 sessions)
- Comparative study of container technologies: Docker, SWARM, Kubernetes (2 sessions)
- Edge-Cloud technology (1 session)
- Cloud-based Function-as-a-Service, Serverless Computing (1 session)
- Network Resource Virtualization (1 session)
- Security for Cloud (1 session)
- Platform-as-a-Service (2 sessions)
- Continuous Delivery and Deployment in a Cloud environment (1 session)
- Persistence services and Database-as-a-Service (1 session)
- Cloud-Native applications (1 session)

Méthodes d'enseignement et d'apprentissage

2 périodes de cours, 1 période d'exercice et travail pratique par semaine – 75% des exercices et travaux pratiques doivent être rendus à temps et validés pour pouvoir passer l'examen. En plus des 3 périodes du cours, l'équivalent de 3 périodes de travail personnel est demandé à chaque étudiant.

Modelling methods

Brief course description of module objectives and content

Theory of complex systems and dynamics to understand challenges of markets and chances for new technologies, to identify niches for innovation in aviation and to handle complexity.

Risk management and decision making under uncertainty: Dealing with dilemmata

Methods for simplifying and communicating complexity.

Enhancement of collaboration to unfold interdisciplinary potentials: Develop a culture of learning and growth.

Enabling participation: Integrate multiple interest groups throughout the conception and design process.

Management of an innovation process: Learn from success and failure. Develop a business model for a new product/service. Predict near- and longterm development with modelling and scenario techniques to address uncertainty and risk.

Understand challenges for transformation (market pressures, legal aspects, certification requirements, public acceptance, organisational aspects, resistance to change). Manage change process.

Pitch: Elaboration and presentation of an innovative idea to a group of investors.

Aims, content, methods

Learning objectives and acquired competencies

Understand and enhance performance in complex systems. Cope with interdependence and insecurity. Develop new solutions in a complex market.

Assess potential for innovation: Take advantage of chances, avoid unnecessary risks.

Balance multiple requirements: technical, economic, human, environmental aspects and social acceptance.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge****Prerequisites:**

- Basic knowledge of machine learning (e.g. Andrew Ng's ML course on Coursera)
- Good command of an imperative programming language, basic knowledge of Python (the module will use Python 3).
- <http://www.scipy-lectures.org/index.html> Sections 1.1, 1.2, 1.3, 3.6.1, 3.6.2
- Basic knowledge of probability, statistics, linear algebra (vectors, matrices)
- Students are expected to take their laptops for the Lab activities

Brief course description of module objectives and content

Analyzing images is a very complex task that has many important real-world applications. This module presents powerful techniques to extract information from images and 3D data, based on machine learning and deep learning methods. These methods are mostly used as "black boxes" and their inner workings are not discussed in much detail. The module provides an overview of many image analysis applications such as document

analysis, medical imaging and autonomous driving; examples of advanced uses of deep learning on images (generative networks for image synthesis, adversarial networks, neural style transfer) are also discussed.

Aims, content, methods

Learning objectives and acquired competencies

- Students know how images and 3D data are represented and manipulated by software
- Students know the most important problems related to image analysis: e.g. image classification, segmentation and object detection and tracking
- Students can apply machine learning and deep learning techniques to solve image-related problems, and deal with practical issues arising in the field (dataset engineering, data augmentation, data normalization)
- Students have seen different examples of image analysis problems and common solution techniques, and are able to acquire additional expert knowledge from the scientific literature and online resources

Contents of module with emphasis on teaching content

- Introduction
- Basic image processing methods applied to document processing: binarization; segmentation of text into lines, words and characters; connected component analysis.
- Image classification
 - applications to OCR: handcrafted features; convolutional neural networks.
 - Image classification with small datasets: data augmentation techniques; one-shot learning; transfer learning and pre-trained models.
- Segmentation
 - applications to medical images (2D, 3D)
 - fully convolutional networks for semantic segmentation.
- Object detection
 - face detection with cascading classifiers
 - pedestrian detection for autonomous driving
 - object tracking in videos.
- Generative models and Image Synthesis
 - Applications to Image Inpainting;
 - Generative Adversarial Networks;
 - Neural style transfer.

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- basic python scripting
- basic mathematical analysis and linear algebra

Brief course description of module objectives and content

The module is organised around 4 core subject areas:

- Data Preprocessing

- Data Classification
- Clustering
- Complex Networks

Aims, content, methods

Learning objectives and acquired competencies

Students understand how to use database technologies and data analysis tools and languages to process large data collections.

- They learn the basics of the analysis of large data sets
- They know the main tools to address analysis of large data sets
- They will learn and use the most common classification techniques
- They will learn methods for processing and clustering with the purpose of effective analysis
- They can reuse the material acquired in this course in their own working environment and apply them to solve their specific problems
- They know the current research directions within these domains.

Contents of module with emphasis on teaching content

The content of the module is the following:

- Introduction to data analysis
- Data Preprocessing (noise and outliers, aggregation, PCA, features selection, etc.)
- Linear Regression, Logistic Regression
- Data Classification and classifier evaluation
- Clustering and cluster validation
- Recommendation Systems
- Complex Networks

Teaching and learning methods

Problem based learning. During the lesson the lecturer will introduce real world problems and the class will try to solve them together. The lecturer will support the problem solving process, introducing new concepts, as required.

Literature

Lecture slides, references to internet resources and books

Assessment

Certification requirements

Module uses certification requirements

Certification requirements for final examinations (conditions for attestation)

The successful delivery of solved exercises is condition for entering the examination, and will contribute to the final mark.

- Relational Models, Relational Algebra
- Normalization
- SQL:92
- Transaction Processing, Concurrency Control
- Security in relational database systems
- Query optimization (btree indexes)
- RDBMS architectures

Brief course description of module objectives and content

This course is about Data Engineering and Information Retrieval. It covers methods and technologies for managing, processing and analyzing potentially large and distributed data collections, including multi-model databases and NoSQL stores. And it covers also mastering data in unstructured form (full text search). The course consists of four parts: 1. Database management; 2. Data warehousing and data analytics (business intelligence); 3. Data integration including data synthesizing; and 4. Information Retrieval.

Aims, content, methods

Learning objectives and acquired competencies

This module covers following important aspects of Data Engineering:

- Students understand the use of modern database technologies for processing and managing large and distributed data collections.
- Reaching beyond RDBMS, students learn about data structures (data types) and know which of these to use depending on the requirements and type of data available (polyglot persistence, multi-model databases).
- The students know NoSQL stores and selected cloud data stores.
- The students know methods and tools to integrate, to cleanse and to synthesize data.
- Students know how to deal with full text information using databases and search engines (information retrieval).
- The students can also apply the acquired knowledge in their own working environment.

Contents of module with emphasis on teaching content

The lecture is divided into four parts:

1. Database Management (DB): New data structures and alternatives to RDBMS. The first part deals with the storage of data and with the non-relational aspects, including NoSQL and cloud data stores
2. Data Warehousing and Data Analytics (DW): The second part deals with data warehousing, i.e. data aggregation and data analytics (business intelligence).
3. Data Integration (DI): In the third part, methods and tools for data integration, data cleansing and data synthesizing (e.g. for training and testing) are explained.
4. Information Retrieval (IR): The fourth part deals with finding information in full text using databases and (enterprise) search engines, including crawling..

Weighting:

1. DB: 4 - 6 weeks
2. DW: 3 weeks
3. DI: 1 week
4. IR: 4 - 5 weeks

Teaching and learning methods

Frontal teaching, exercises, case studies.

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledgeLinear algebra: vector and matrix operations, Eigenvectors and λ -values

Multivariate calculus: partial differentiation, chain rule, gradient, Jacobian and Hessian

Statistics and probability theory: discrete and continuous distributions, multi-variate distributions, probability mass and density functions, Bayes' Rule, maximum likelihood principle

Programming: Experience in a programming language with good understanding of loops and data structures such as arrays/lists and maps/dictionaries; understanding of object oriented programming concepts. The course is taught using Python.

Brief course description of module objectives and content

Deep Learning is one of the most active subareas of Machine Learning and Artificial Intelligence at the moment. Gartner has placed it at the peak in its 2017 Hype Cycle and the trend is going on. Deep Learning techniques are based on neural networks. They are at the core of a vast range of impressive applications, ranging from image classification, automated image captioning, language translation such as Google Translate, to playing Go and arcade games.

This course focuses on the mathematical aspects of neural networks, their implementation (in Python), and their training and usage. Students will learn the fundamental concepts of Deep Learning and develop a good understanding of applicability of Deep Learning for Machine Learning tasks. After completing the course, students will have developed the skills to apply Deep Learning in practical application settings.

Aims, content, methods

Learning objectives and acquired competencies

Students will

- have a thorough **understanding of neural network architectures** including convolutional and recurrent networks.
- know **loss functions** (e.g. categorical cross entropy) that provide the optimization objective during training.
- understand the principles of **back propagation**.
- know the benefits of **depths and representation learning**.
- know some of the **recent advances** in the field and some of the **open research questions**.
- develop the ability to decide **whether Deep Learning is suitable** for a given task.
- gain the ability to **build and train neural network models** in a Deep Learning Framework such as TensorFlow.

Contents of module with emphasis on teaching content

- **Introduction:** Logistic Neuron, training and cost functions.
Architectures: Feed-forward and recurrent networks. Applications of neural networks.
- **Optimization strategies:** Minimization of loss functions, gradient descent, stochastic gradient descent, mini-batch gradient descent, implementation of gradient decent optimizers in Python.
- **Training of Deep Neural Networks:** Backpropagation, computational graphs, automatic differentiation, special optimizers, such as Nesterov accelerated gradient, AdaGrad, or RMSProp; tricks for faster training, batch normalization, gradient clipping, special activation functions such as non-saturating activation functions, regularization using dropout.
- **Multilayer Perceptron (MLP):** implementation of an MLP including backpropagation in Python.
- **Convolutional Neural Networks (CNNs):** Convolutional and pooling layers, data augmentation, popular CNN architectures, transfer learning, applications.
- **Practical Considerations and Methodology:** Deep Learning frameworks such as TensorFlow; gpu vs cpu; visualizations such as activation maximization, class activation maps, saliency maps; performance metrics, selecting hyper-parameters, debugging strategies.
- **Recurrent Neural Networks:** Vanishing and exploding gradients, special memory cells, such as Gated Recurrent Units (GRU) or Long short-term memory (LSTM), static and dynamic unrolling, sequence classifiers, sequence-to-sequence models, encoder-decoder for language translation.
- **Special and Current Research Topics** such as
 - Autoencoders: principal component analysis using autoencoders; special applications such as denoising auto-encoders.
 - Generative Adversarial Models.
 - Learning embeddings for word representations, attention mechanism, transformers.

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Kenntnisse in Zeichnungsprogrammen (CAD, InDesign) sind hilfreich, aber nicht zwingende Voraussetzung.

Kurzbeschreibung der Inhalte und Ziele

Das Modul vermittelt methodische Grundkompetenzen für den architektonischen Entwurf. In praxisorientierten Übungen als Einzelarbeit oder in Gruppen werden theoretisches Wissen angewendet, Kenntnisse vertieft und interdisziplinäre Zusammenarbeit geübt.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Die Studierenden erwerben die Fähigkeit, architektonische Entwurfsaufgaben eigenständig und strukturiert zu bearbeiten. Sie lernen unterschiedliche methodische Verfahren und Techniken kennen und anwenden. Einfache Projektarbeiten erstrecken sich dabei vom Einzelobjekt bis zu kleineren städtebaulichen Aufgaben.

Modulinhalt mit Gewichtung der Lehrinhalte

In einem ersten Kursteil werden verschiedene Mittel und Instrumente des architektonischen und städtebaulichen Entwurfs eingeführt und angewendet (Themenschwerpunkte: Ortsbauliche Werte-Analyse, Erarbeiten von Entwurfs-Konzepten, prozessuale Projektentwicklung). Zu jeder Vorlesung ist eine thematisch entsprechende Kurzübung angelegt.

Raumwahrnehmung und Raumbildung sowie unterschiedliche methodische Verfahren bilden den ersten Teil des Moduls. Im zweiten Teil wird eine entwerferische Übung über fünf Wochen entwickelt. Im Zentrum des Kurses stehen Anwendung und Umsetzung von theoretischen Erkenntnissen in der praxisorientierten Übung und der Diskurs unter Studierenden und Dozierenden.

Lehr- und Lernmethoden

Der Kurs umfasst Wissensvermittlung in Form von Vorlesungen und die Vertiefung erworbener Kenntnisse durch Anwendung in betreuten Entwurfsübungen (Atelierunterricht). Gruppenarbeiten dienen der gemeinsamen Erarbeitung von Themen und der Verbesserung der kommunikativen Kompetenz.

Programming skills in Java

Ground software engineering skills (in particular design pattern, concurrent programming and application development for the web)

Brief course description of module objectives and content

This course focus on software technologies, architectures, and methodologies for development of cloud-native applications.

Aims, content, methods

Learning objectives and acquired competencies

This course provides detailed skills on contemporary software solutions that allow developing cloud-native applications. The course will introduce and deepen the recent evolution of technologies, architectures and methodologies for microservice-based systems, by taking advantage of a DevOps approach.

The course goal is the consolidation of required advanced technical skills for modern software development in the cloud, with particular care on the role played by the recent innovations.

The course will be proposed as a combination of lectures and exercises, including practical demonstrations and laboratory development. Readings will be assigned to students as complementary deepening material.

Contents of module with emphasis on teaching content

The student will be provided knowledge about modern development methodologies, frameworks and tools, including:

- Introduction to cloud computing technologies (IaaS, PaaS, SaaS and other fundamentals)
- Tools and methodologies for DevOps and CI/CD
- Container technologies (Docker)
- Infrastructures for container orchestration (Kubernetes)
- Frameworks for REST APIs development (Spring Boot)
- Software architectures and design patterns for microservices
- Protocols and technologies for message queuing (AMQP) and for inter-process communication (gRPC)
- Serverless computing technologies (FaaS and lambdas)
- GraphQL (with Spring Boot)
- Techniques for infrastructure as a code (Terraform)
- Service mesh technologies (Istio, Linkerd)
- Tools and frameworks for monitoring and logging (Prometheus, Fluentd)
- Storage orchestrators for kubernetes (Etcd, Rook)
- Tools and frameworks for testing: unit, integration, component, contract, end-to-end

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

This course requires knowledge about

- the electronic - also sensor-based - structured data acquisition,
- user Centered design,
- a good understanding of database-concepts,
- information systems and
- general data analysis.

Brief course description of module objectives and content

This course provides an in-depth overview of data management in digital healthcare.

First, the special features and challenges of medical documentation will be discussed followed by the underlying ontologies, classifications and scoring

systems. Particular emphasis will be placed on a deeper understanding of different dimensions of interoperability. This knowledge will then be used to address exemplary specific medical information systems.

BigData technologies will then open the next section which deals with the particular challenges of digital transformation in healthcare. In particular, the inclusion of patients in future data collection will be discussed and demonstrated, as well as the potential of the merging of LifeStyle data, vital data and medical documentation. The topic of data reuse from the different medical applications combined with security issue within the emerging Data Science Centers is also the subject of this module. Finally, the new challenges for software development in the context of the Medical Device Regulation (“MDR”) are presented.

Aims, content, methods

Learning objectives and acquired competencies

The aim of this lecture is to understand,

- how Data are collected in medicine,
- how these data are organized in a structured and interoperable way,
- the importance of information systems in this context,
- the role of these systems as a basis for digital transformation in the healthcare sector,
- how information systems can be linked with eHealth, mHealth (“mobile Health”), pHealth (“personalized Health”)
- how future active assisted living can be supported
- and the impact of MDR on the professionalization of medical software and apps.

Contents of module with emphasis on teaching content

First Part (6 weeks):

- Medical & Health Data Documentation (1 week)
- Medical Ontologies and Classification (2 weeks)
- Dimensions of Interoperability in Health Care Systems (2 weeks)
- - Hospital & Health Care Information Management Systems (1 week)

Second Part (8 weeks):

- BigData Technologies (1 week)
- Digitalization & Transformation in Treatment Pathways (1 week)
- eHealth & EPD (1 week)
- mHealth & App – Ecosystems (1 week)
- Privacy & IAM in cybersecurity (1 week)
- pHealth and Data Science Center (1 week)
- Home Monitoring (1 week)
- MDR (1 week)

Entry level competences**Prerequisites, previous knowledge**

None.

Brief course description of module objectives and content

This module offers an overview of digitization in industry from several perspectives.

Content**Section 1: Product Lifecycle Management**

- Introduction of end-to-end process (As-Required, As-Design, As-Built, As Maintained)
- Product lifecycle and closed loop lifecycle management

- Development of mechatronic products (HW/SW Co-Development)
- Generating master data for mechatronic products
- Customizable products and modularization
- Engineering Change management

Section 2: Digitization in Production

- Introduction to Production Management
- Prozessleitsysteme, Bussysteme und Protokolle, MES
- Optimization of production based on digital tools
- Examples and Use Cases of digitization in production
- Lean Management and digitization

Section 3: Digitalization of Products

- Digitization driven new Business Models
- Sensor to information: communication and aggregation of data
- Reliability, security and accessibility
- Digital Twins
- Discussion of specific Use Cases - Market & Operational Excellence

Aims, content, methods

Learning objectives and acquired competencies

- The students obtain an overview of the processes, data structures and information flows based on different product strategies inside a company.
- They are qualified to evaluate different approaches to organize a company regarding the product strategy, product architecture, the production processes and the deployed IT solutions. Relying on this, they are able to identify and apply optimization strategies.
- They are familiar with state-of-the-art concepts of digitization in order to classify efficiency and transparency in production processes (industry 4.0).
- They are familiar with the basic concepts of digitized products (Internet of Things) and how these are linked to the processes and data streams of the original company in order to increase the range of product related services or business models.
- They can rationally decide between "digital" and "non-digital" solution concepts.

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Bases de la mécanique technique, principe fondamental de la dynamique
 Calcul vectoriel et matriciel simple, nombres complexes
 Les connaissances de base de Matlab sont un avantage
 Connaissance de base des transformations de Fourier et de Laplace

Brève description du contenu et des objectifs

Le module fournit des méthodes et des procédures pour comprendre, calculer et mesurer le comportement dynamique des structures mécaniques et montre leur importance pour le développement des structures porteuses.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants comprennent les méthodes de calcul et d'expérimentations de la dynamique des structures et connaissent leurs possibilités et limites.

Contenu des modules avec pondération du contenu des cours

- Oscillateur mono-masse à 1 degré de liberté : Etablissement des équations de mouvement, solution des équations de mouvement homogènes (oscillations libres) et non-homogènes (oscillations forcées), détermination des valeurs propres du système, fonction de transfert (réception, mobilité, accélération), réponse aux signaux d'entrée simples,
- Oscillateurs multi-masses à N degrés de liberté : Etablissement d'équations de mouvement, solution d'équations de mouvement homogènes (oscillations libres) et non homogènes (oscillations forcées) ; solution du problème de la valeur propre et analyse des valeurs propres et des vecteurs propres, fonctions de transfert (réception, mobilité, accélération), réduction modale,
- Analyse modale expérimentale : motivation et objectifs, chaîne de mesure pour les mesures vibratoires, traitement du signal, identification, présentation d'exemples pratiques,
- Modèles d'amortissement pour oscillateurs multi-masses, amortissement modal, amortissement de Rayleigh, détermination de l'amortissement sur la demi-largeur
- Dynamique du rotor
 - Etablissement des équations de mouvement pour un modèle mono-disque à effet gyroscopique et arbre élastique
 - Valeurs propres en fonction de la vitesse de rotation (diagramme de Campbell),
 - Excitation par équilibrage statique et dynamique, vibration stable et contre-rotative
- Introduction à la simulation multi-corps :
 - Etablissement d'équations de mouvement pour un modèle multi-corps non linéaire, cinématique, cinétique, espace d'état
 - Elimination des forces de liaison via des matrices jacobiniennes,
 - Solution numérique d'équations mécaniques non linéaires du mouvement

Méthodes d'enseignement et d'apprentissage

- Cours magistraux
- Expériences pratiques
- Discussions de cas pratiques

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

The students have a working knowledge of programming embedded systems in C.
The students have a working knowledge of basic hardware design including VHDL coding

Brief course description of module objectives and content

This module introduces the student to advanced concepts in modern embedded systems engineering. The module is divided into two sections. The first section is practical/theoretical and is designed to get the student familiar with implementing System on Chip (SoC) designs. The second part discusses formal Hardware/Software Co-Design including design and implementation of advanced embedded architectures as well as the verification and test of the resulting system.

Aims, content, methods

Learning objectives and acquired competencies

- The student will know some of the forces driving the design of modern embedded architectures.
- The student will understand and be able to apply the V-Model and structured HW/SW Co-Design methodologies including strategies for the verification and test of embedded systems.
- The student will be able to design and implement complete SoC designs including using soft-core microprocessors and IP cores in an FPGA.
- The student will be able to apply loop optimisations using both SW techniques and optimised cache in single- and multi-processor architectures.
- The students will be able to understand and apply pipeline architectures in processors (super-pipelined, superscalar), HW and SW.

Contents of module with emphasis on teaching content

- Introduction
 - V-Model, specification and test
 - HW-SW Co-Design
- SoC design, implementation and test
 - FPGA technology, SoC design, soft-core processors, design, implementation and reuse of custom IP cores
 - Bus systems
- Optimisation Strategies
 - Advanced peripherals, DMA, scheduling
 - Software loop optimisations, custom instructions, co-processors,
 - Memory hierarchy (cache, scratch pad memories)
 - Pipeline, multiprocessing
- Review
 - Exercises and laboratories using an FPGA board

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Les étudiants jouissent de connaissances professionnelles des systèmes de programmation en C.

Les étudiants jouissent de connaissances professionnelles des bases de la conception matérielle y compris le codage VHDL

Brève description du contenu et des objectifs

Le présent module donne aux étudiants un aperçu sur les concepts avancés de technologies modernes d'ingénierie embarquée. Le module se subdivise en deux parties. La première partie est consacrée à la pratique/théorie et vise à familiariser l'étudiant à mettre en oeuvre des systèmes de conception de puces. La deuxième partie aborde la conception conjointe formelle matérielle et logicielle, y compris la conception et la mise en oeuvre d'architectures embarquées et la vérification des systèmes créés.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- L'étudiant connaîtra quelques-unes des forces intervenant dans la direction des architectures embarquées modernes.
- L'étudiant comprendra et sera capable d'appliquer des méthodes de co-design matériel et logiciel, ainsi que des stratégies de test et de vérification des systèmes embarqués (vérification conjointe HW/SW).
- L'étudiant sera capable de concevoir et de mandater des designs SoC complet sur un FPGA.
- L'étudiant sera capable de concevoir des SoC au moyen des technologies suivantes- processeurs softcore (multiples), co-processeurs (instructions programmables, coprocesseurs fortement couplés, processeurs de signal) et accélération matérielle.
- L'étudiant comprendra et appliquera les techniques d'optimisation logicielle avancées.
- L'étudiant devra réaliser des exercices pertinents sur une carte de développement adéquate.

Contenu des modules avec pondération du contenu des cours

- Introduction
 - Technologie FPGA
 - conception SoC, processeurs soft-core, modules auto-conçus
 - systèmes de bus, DMA, hiérarchie mémoire (caches, SPM)
- Architectures des automates
 - Processeurs softcore, instructions programmables, coprocesseurs, architectures de processeurs
 - Firm/software embarqués et techniques d'optimisation
 - Interfaçage périphérique, accélération matérielle
- Test et vérification
 - Vérification conjointe matérielle et logicielle et stratégies de contrôle
- Examen
 - Exercices et laboratoire utilisant une carte FPGA

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Programming language C++/C
- Computer architectures
- Fundamentals of Operating Systems

Brief course description of module objectives and content

Embedded Systems, although they are not visible, they have become integral parts of this world. Embedded Systems essentially consist of two components, hardware and software. In contrast to information systems in the banking world, hardware is more application specific. Due to this fact, the software that interacts directly with the hardware is more specific as well.

Real-time and Concurrency are important issues in Embedded System development, which come on top of the generally valid requirements for correctness and reliability.

The module teaches methods to develop Embedded System Software and deals with the following two complementary aspects:

- Embedded Programming, Programming close to hardware
- Abstract Modeling Concepts.

Both parts are based on Object-Oriented Concepts.

Aims, content, methods

Learning objectives and acquired competencies

Based on requirements, the students will be able to apply the optimal method to develop and verify an Embedded System,

- on the boundary between hard- and software using modern C++,
- on application layer using modeling methods.

Contents of module with emphasis on teaching content

In the first part, the focus is on Near-Hardware-Programming. We use a typical (small) System on Chip (SoC) equipped with a RISC V.

The programming language is C++, the programming environment is Linux.

- Using C++: showing the huge advantages of C++ for a small SoC
- ISA Instruction Set Architecture
- Hardware-Access
- Concurrency
 - for a SoC
 - for a Linux based System

In the second part, the focus is on modeling, a model driven approach: from requirements, over modeling to the running system

- Introduction
 - Development Process
 - Generic Software-Architecture
- Modeling functional requirements
 - System of cooperating state machines
 - CIRO (Communicating Interacting Reactive Objects)
- Modeling connection software
 - Connection between hardware and reactive system
- Code Generation
 - Generated Code
 - Strategies
 - Tools?
- Testing executable Models
- Real-Time Scheduling
 - Multi-Tasking
 - Distribution
 - Task and Event Scheduling
- Exercises and laboratories using concrete tool-chain and microcontroller

Teaching and learning methods

- Ex-cathedra teaching
- Exercises
- Self-study (study of papers, case studies)

Literature

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basics in chemistry and physics

Brief course description of module objectives and content

This course will provide the student with the background knowledge useful to address different sources of pollution, of measures and technologies to prevent pollution and of contaminated systems and the available technologies for remediation. General aim is knowing the main factors and processes affecting contaminants distribution in the environment and remediation technologies for soil groundwater and atmosphere.

Aims, content, methods

Learning objectives and acquired competencies

The student will acquire the tools to be able to understand environmental problems, know the key-factors of remediation and the challenges of the near future, integrate knowledge of chemistry, biotechnology and ecology and read and understand up to date literature on remediation topics

Contents of module with emphasis on teaching content

PART 1 general concepts of:

- environment, ecosystem, pollution, remediation.
- contaminants and emerging contaminants characteristics.
- representative sampling and monitoring.

PART 2 environmental compartments and contaminants:

- physical chemical and biological characteristics of soil;
- physical chemical and biological characteristics of groundwater;
- physical chemical and biological characteristics of atmosphere;
- contaminant transport and fate: physical chemical and biological processes in soil, water and atmosphere.

PART 3 remediation:

- containment technologies;
- removal technologies;
- treatment technologies.

Teaching and learning methods

front lecturing theory lessons and student active involvement

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

No specific previous knowledge is required, considering that for each topic a short introduction is proposed before moving to the concept application.

Brief course description of module objectives and content

The course will describe Production Systems Configuration and Management as well as the drivers influencing the choice of a given layout and the rules adopted for managing it. Various typical layouts will be described also highlighting their benefits and pitfalls, while eliciting the characteristics of the manufacturing environments justifying their choice. Well known Production Planning & Control (PPC) methods will be presented and applied. Basis on market demand forecasting will be provided.

Aims, content, methods

Learning objectives and acquired competencies

Being able to understand:

- The basics of product layouts and process layouts
- Push production systems
- Inventory management methods
- Simple forecasting methods

Being able to:

- Solve simple line-balancing problems
- Dimension simple cellular layout
- Select the suitable PPC method and dimension it
- Create forecast and evaluate their quality

Contents of module with emphasis on teaching content

Introduction to Factory Planning

- Production models and production systems
- The influence of product structure and Customer delivery lead time
- Classification: MTS, ATO, MTO, ETO
- Levers of action for production system configuration
- Product-Process matrix
- Performance Indexes (KPI)
- Job Shop
- Production Line Balancing
- Group technology and manufacturing cells

PUSH Production Planning and Control

- Sales and Operations Planning (S&OP)
- Master Production Schedule (MPS)
- Material Requirement Planning (MRP)
- Capacity Planning (Rough Cut Capacity Planning; Capacity Requirement Planning)
- Dispatching rule

Inventory Management and Forecasting

- Inventory Management costs and Economic Order Quantity (EOQ)
- Power-of-Two method, EOQ Price discount, Production Economic Order Quantity
- Inventory Management Methods; Replenishment, Periodic Order Quantity (POQ)
- Safety Stock
- Forecasting methods (time series analysis)

Teaching and learning methods

Frontal theoretical lessons integrated with interactive exercises

Literature

The material distributed by the lecturer is enough, reference books can be suggested if the students want to deepen the knowledge of specific subjects, for instance:

- Factory Physics, Wallace J. Hopp and Mark L. Spearman, Waveland Pr Inc; 3 edition (August 31, 2011)
- Manufacturing Planning and Control for Supply Chain Management: The CPIN Reference, F. Robert Jacobs, William Berry, D. Clay Whybark, Thomas Vollmann, McGraw-Hill Professional; 2nd edition (July 23, 2018)
- Forecasting: Methods and Applications, Spyros G. Makridakis, Steven C. Wheelwright, Rob J Hyndman, Wiley; 3 edition (December 1997)

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic IT knowledge

Interest in dealing with geodata

Interest in cloud environments and processing of very large data sets

Brief course description of module objectives and content

After studies had shown that 80% of all decisions in business and private life are based on geodata, this now also applies increasingly to Big Data. Modern programming languages such as Python have developed into an easy-to-learn and powerful tool for processing this data. Python is the most frequently used programming language for processing geographical data, especially because of its simplicity, the extensive standard library and the large number of extensions.

Python was used, for example, for Space Shuttle Mission Design or for processing images from the Hubble Space Telescope. Python is also used for highly scalable web applications such as YouTube or the internal Google infrastructure.

At the same time, the availability of (geospatial) data has changed drastically in the last decade. There are more and more data sources - especially thanks to Open Data initiatives. In addition, there is an increasing number of mobile, Internet-enabled devices that make it possible to access data from anywhere and at any time. The availability of storage and computing capacity through cloud computing services has helped to make new data-centric services possible, especially on mobile devices and in web browsers.

A major challenge today, however, is the explosion of data volumes. Traditional methods for data storage, data processing and data evaluation using relational databases and SQL have been the way to work with large amounts of data for decades. For some years, however, there have been alternatives such as Hadoop, NoSQL or Map-Reduce, which can handle this much more efficiently within their area of application. This module shows the possible uses of Python for (geo)data processing, for handling big data, for data handling and analysis and in cloud computing. This module shows the application possibilities of Python for (geo) data processing, for handling big data, for data handling and analysis and in cloud computing, as well as the combinability of the individual building blocks to an entire workflow.

In the first part, the programming language Python is introduced, and Python modules for handling and processing data are discussed.

The second part deals with big data, data analysis, and cloud computing.

Aims, content, methods

Learning objectives and acquired competencies

Technical goals:

- Learning the programming language Python and the Jupyter Notebook
- Using Tools & Python modules from the field of geo data processing
- Dealing with Python modules in the area of Big Data, NoSQL and Map-Reduce
- Gain the ability to develop your own programs to analyze data sets
- Processing of data records in the cloud

Methodological objectives:

- Develop, compare and present solution concepts, structure and document developed solutions, find online forums and use them to solve problems.

Contents of module with emphasis on teaching content

Part 1: Python & (geo-)data & geo-libraries

- Introduction to the programming language Python with the Jupyter Notebook
- Introduction to Numpy and Pandas
- Introduction to spatial reference and geographical data (reference systems, projections, transformations etc.)
- Processing of spatial data (reading, creating and modifying raster and vector data)
- Analysis and visualization of spatial data
- Working with spatial databases (import, export, data manipulation)
- Processing of (spatial / OGC) web services

Part 2: Big Data Processing & Cloud Computing

- Introduction Big Data
- Big Data data model (compute, modeling, storage)
- Data storage of very large data sets
- Hadoop (Python API, HDFS, Map-Reduce, Cluster processing)
- NoSQL database systems (application-oriented, focus on geodata)
- Scaling using cloud computing and parallel computing

Teaching and learning methods

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic knowledge of thermodynamics and fluid dynamics.

Brief course description of module objectives and content

The basic theories of heat transfer by conduction, convection and thermal radiation are presented. However, this study-unit focuses on solving practical heat transfer problems in different fields of engineering such as architectural and HVAC engineering, mechanical and process engineering, electrical as well as environmental engineering.

Aims, content, methods

Learning objectives and acquired competencies

Students shall learn how to solve engineering problems in the field of heat transfer.

Contents of module with emphasis on teaching content

- Overview of Heat Transfer Modes
- Introduction to Conduction
- One-Dimensional, Steady-State Conduction
- Two-Dimensional, Steady-State Conduction
- Transient Conduction
- Introduction to Convection
- External Flow
- Internal Flow
- Free Convection
- Introduction to Radiation
- Radiation: Processes and Properties
- Radiation: Exchange Between Surfaces

Teaching and learning methods

Presentation of theory and practical examples of heat transfer problems, problem solving

Instruction				X E 100%
Documentation				X E 100%
Examination				X E 100%

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic knowledge of thermodynamics, heat transfer and fluid dynamics.

Brief course description of module objectives and content

The course imparts knowledge on practical design methods for thermal systems such as heating and cooling circuits, solar thermal systems and district networks. Special emphasis is placed on the conditions for safe operation. The design and integration of storage tanks and heat pumps into thermal networks is also covered. Furthermore, building physical aspects and practical rules regarding pipe routing, building integration, and maintenance are discussed as well.

Aims, content, methods

Learning objectives and acquired competencies

Practical design problems are best solved in a holistic approach. It is therefore advantageous to solve thermodynamic and hydraulic dimensioning problems in conjunction. This approach is expressed by the term "thermal-hydraulics".

The students will learn how to solve thermal hydraulic engineering problems in the fields of building technology, solar thermal energy and thermal network design.

The aim of these methods is to enable the design of energetically and economically efficient as well as maintenance friendly technical components and systems, and, to prove their functionality by way of simulation.

Contents of module with emphasis on teaching content

A short introduction into thermodynamics, fluid mechanics as well as mass and heat transfer will be given, tailored to the needs of this course. The theory of two-phase flow is taught to the degree necessary to deal with the ventability of pipe networks and the stagnation safety of solar thermal plants.

Dedicated code snippets and open source simulation tools allow the students to apply the methods to real cases.

Teaching and learning methods

The content is taught in frontal lessons.
Numerous examples are motivated and illustrated by story-telling.

Homework exercises are solved using the provided VBA codes running under Excel.

Literature

The script is provided in the form of ppt-presentations.

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

This module assumes that students have a working knowledge of basic security technologies such as cryptology, secure communication protocols, and access control mechanisms (which amounts to approx. a 4 ECTS bachelor module). See e.g.: William Stallings, Network Security Essentials: Applications and Standards. We also assume that students have a working knowledge in a general purpose programming language such as Java, C, or similar and are familiar with modern software development processes.

Brief course description of module objectives and content

This module teaches two aspects of IT security. The first part deals with secure software, focusing on developing secure software and exploiting defects in software. The second part deals with several advanced security technologies, which includes authentication, access control, network security devices, and operating system security.

Aims, content, methods

Learning objectives and acquired competencies

- The students know and understand the secure development lifecycle and are capable of developing secure software.
- The students can analyze software with respect to security and can exploit vulnerabilities.
- The students can employ threat modeling to identify threats and use this to define security requirements.
- The students know and understand advanced authentication and access control methods including identity federations.
- The students understand the underlying principles of application layer firewalls and intrusion detection/prevention systems.
- The students are able to apply the current network access control standards to establish trust in client platforms.

Contents of module with emphasis on teaching content

The module consists of 2 main topics, Software Security and Security Technologies. Each covers 6-8 weeks.

- Main topic 1: Software Security. The skills taught here are applicable to any software project and therefore include web applications, web services, and mobile applications.
 - Introduction to software security (motivation, secure development lifecycle)
 - Finding and exploiting vulnerabilities in software (e.g. web applications) by combining manual methods and tools
 - Developing secure software (e.g. web applications and web services)
 - Security requirements engineering and threat modeling
- Main topic 2: Security Technologies. The skills taught here are applicable to a wide range of scenarios, and include Internet and operating system security.
 - Advanced access control and authentication methods and federated identities
 - Application level firewalls and intrusion detection/prevention systems
 - Internet security, e.g., network access control
 - Operating system security and trusted platforms

Teaching and learning methods

- Lecture: Ex cathedra teaching
- Exercises/self-study: reading texts about security topics, some self-study, mainly about web application development frameworks; practical exercises (computer-based); theoretical exercises

Literature

Lecture slides, references to Internet sources and textbooks

Brief course description of module objectives and content

The Machine and Production Operations Control is the core of the module, with focus in PLC and CNC applied to manufacturing and practical laboratory and industrial experiences in logic and numerical control for manufacturing.

Aims, content, methods

Learning objectives and acquired competencies

- to understand tasks and generic architecture of a machine and production operations control system
- to learn which are the functions of a generic PLC and CNC necessary for manufacturing
- to learn configuring and programming PLC and CNC systems through standard languages
- to develop practical exercises on industrial PLC and CNC targets

Contents of module with emphasis on teaching content

The PLC and CNC places and roles in the production chain. The generic architecture of a PLC and a CNC. Configuration and programming of PLC and CNC systems. Examples and simulated part programming and logic control exercises

Teaching and learning methods

Frontal theoretical lessons.

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Connaissances dans le domaine de bases de données relationnelles
- Connaissances de base en statistiques
- Bonnes bases de programmation orientée objets (Java)

Brève description du contenu et des objectifs

-

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Le cours fournit une introduction au domaine de la recherche d'informations et au domaine multidisciplinaire de data mining.
- Les étudiants connaissent l'architecture d'un système de recherche d'information.
- Ils connaissent les modèles de RI (booléen et vectoriel), ainsi que l'utilisation de ces modèles pour déterminer le poids des termes d'indexation et calculer la correspondance entre les documents et les requêtes.
- Ils comprennent les différentes mesures de l'évaluation d'un système de recherche d'information et sont capables d'appliquer les algorithmes de comparaison et d'interpréter leurs résultats.
- Ils connaissent l'utilisation de la librairie Apache Lucene pour l'indexation et la recherche d'information selon le modèle booléen et vectoriel
- Ils connaissent les techniques de détection des documents similaires en utilisant les algorithmes de type « Locality Sensitive Hashing »
- Les étudiants comprennent l'utilisation des technologies modernes de bases de données pour le traitement et la gestion de grandes collections de données.
- Les étudiants reçoivent une introduction au domaine de bases de données multidimensionnelles, aux modèles d'entreposage de données, aux techniques OLAP. Ils connaissent de nouvelles structures de données (types de données) alternatives aux systèmes de gestion de bases de données relationnels (SGBDR) (non relationnelles notamment) et sont capables de déterminer quels types de données et quel système de base de données sont appropriés en fonction du contexte et du genre de données disponibles.
- Ils connaissent les techniques de pré-traitement des données (le concept de qualité des données et les méthodes de nettoyage des données, d'intégration des données, de réduction des données, de transformation des données et de discrétisation des données).
- Ils connaissent les principales tâches de data mining et les méthodes principales associées : analyse descriptive de données, analyse du panier d'achats (règles d'association), classification (arbres de décision), clustering (hiérarchique et non hiérarchique), estimation, détection de données aberrantes, etc.
- Ils sont capables de réutiliser les connaissances acquises durant ce cours dans leur propre environnement de travail et de les appliquer afin de résoudre leurs problèmes spécifiques.

Contenu des modules avec pondération du contenu des cours

Le module s'articule en deux parties, la première est dédiée au domaine de la recherche d'information et la deuxième au domaine de data mining :

1. Basic concepts of IR
2. Boolean retrieval model
3. Vector space model and efficient ranking
4. Query refinement
5. Evaluation of IR systems
6. The Lucene API for Information Retrieval and evaluation
7. Near duplicate detection
8. Introduction to Data Warehousing and OLAP
9. Pré-traitement de données
10. Introduction to Data Mining
11. Classification
12. Market basket Analysis
13. Clustering
14. Estimation

1. Recherche d'information: 7 semaines
2. Data mining: 7 semaines

Méthodes d'enseignement et d'apprentissage

Enseignement magistral, exercices, des laboratoires.

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Basic programming knowledge (any programming language)

Basic knowledge of data visualization and data graphics (e.g. Wong 2010)

Brief course description of module objectives and content

More and more complex data is collected in a wide range of application areas. Thus, with the goal of gaining insight into the data and information as well as communicating the resulting knowledge, the need for efficient visual methods is growing rapidly. We need to know the options for effective and efficient visual representations, for example for communication and fact-based decision making, as well as to develop new methods for visual data exploration to gain insight and learn from the collected data. Specifically also new user interfaces are needed to allow the interaction with and exploration of big, dynamic and multidimensional data sets as well as contextual information.

The module Information Visualization builds on basic knowledge of data visualization and data graphics (e.g. Wong 2010). It starts with an introduction before going into the details of important concepts of information visualization as well as the options and techniques for the design of static and dynamic visual user interfaces. A specific focus is given to the visual analysis of uni- and multidimensional data as well as the communication of information (infographics). Typical questions that shall be answered through visual data analysis include the perspectives 'What?', 'When?', 'Where?' and also often 'With whom?'. Thematic, temporal, spatial and network data sets all have specific characteristics that need to be considered when designing suitable representations for visual analysis and communication. In addition to learning and teaching the basic and applied visualization knowledge, content from current research in information visualization are included in the module (advanced visualization topics).

The theoretical contents of the module are complemented with a series of exercises. These allow to deepen and broaden the theoretical knowledge through practical application. The visualization tools used in the module exercises are open. It is thus possible to try out a range of visualization tools (e.g. R, D3.js or Python Bokeh) or otherwise to select one and use it for (almost) all exercises.

Aims, content, methods

Learning objectives and acquired competencies

- The students can apply the theory and the knowledge of visualization methods for the support of efficient and effective visual analysis and communication of different data sets, including thematic (what), temporal (when), spatial (where) and network (with whom) data, from a range of scientific, technical and other application areas.
- The students understand and can apply the most important concepts of colour, layout, typography and other visualization dimensions as well as the knowledge of human perception and cognition for the design of suitable information visualizations.
- The students can apply their knowledge to implement iterative visualization projects to develop effective and goal- and user-oriented data and information visualizations for a range of application areas.
- The students understand different methods for the evaluation of information visualizations as well as their respective opportunities and limitations.
- The students know about the challenges of data preparations and problems such as missing data and can devise and apply suitable coping strategies.
- The students are able to use their knowledge of visualization methods, technologies and concepts to design, implement, and evaluate complex and advanced information visualizations for the analysis of specific data and research questions.
- The students know the current and ongoing topics and questions of information visualization research and are able to assess and suitably include new research results into their visualization work.

Contents of module with emphasis on teaching content

- Repetition and overview of the basics of data and information visualization: data types, dimensions, analysis questions, purpose and audience, visual variables as well as data graphic types, colour, layout, typography, history of (information) visualization
- Principles of the human perception and cognition, applications and limitations, influences on the design of information representations and user interfaces
- Processes of visual data analysis and visual information communication, combination of visualization with other data analysis techniques (statistics, data mining), concepts and techniques of interaction
- Evaluation of information visualizations, usefulness, usability, utility, readability, efficiency and effectiveness
- Data preparation, strategies for missing and unsuitable data, concepts for the visualization of uncertainty and fuzzyness
- Simple as well as more complex visualization types and techniques for the visualization of thematic, temporal, spatial, and network data to analyse the main questions of what, when, where and with whom and combinations thereof
- Applications and exercises of using the different concepts, methods and technologies for different questions and application areas, such as visual analytics, business intelligence, dashboards and information graphics

BSc Business Engineering.

Other with basic knowledge of business principles such as marketing, accounting and controlling

Brief course description of module objectives and content

NOVEL INNOVATION & DESIGN PRINCIPLES. In order to keep generating competitive advantage through innovation, both manufacturing and service industries are in need to apply novel innovation and design principles. This module will focus on reuniting the study and practice of entrepreneurship and innovation. It takes a process-oriented view of agile Innovation.

First it starts with recognizing the opportunity and understanding the problem space using design thinking and selecting appropriate tools and methods. After achieving the Problem/Solution-Fit with the Lean Start-up approach an MVP is further developed and the using agile product and customer development, business design the venture can be scaled.

Alongside this journey, different tools are selected, e.g 5Wh, customer journey, big data Analytics, business ecosystem design canvas, Lean Canvas are applied.

Approaches such as Design Thinking, user-driven innovation, lean startup and lean entrepreneurship, corporate venturing, jugaad innovation will be used to work on one real-life business cases. Different excursions complete the module to see how novel design and innovation principles are applied in practice.

Aims, content, methods

Learning objectives and acquired competencies

- What is agile innovation?
- what are the differences to traditional innovation processes?
- How to apply Design Thinking, Lean Start-up and other user centered approaches
- Select the right tools to achieve the targets for a given Innovation challenge
- The nature of creativity and the creative process
- Moderation of a creativity workshop
- Where innovations come from – the wide range of different source which offer opportunities
- Combine intuitive and analytical problem solving techniques
- Apply key tools like customer journey, Lean Canvas and Business Ecosystem Design Canvas
- The need for a strategy to guide search for opportunities
- Developing and using a business plan to attract resources

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Basic principles of automation technology
- Basic principles of communication technology, e.g. OSI Reference Model, Ethernet, TCP/IP etc.
- Basic principles of statistics and random variables

Brief course description of module objectives and content

In an automation system in manufacturing technology or process automation, sensors measure non-electric values and actuators, such as drives, influence the process. The individual components are controlled by control systems and automatic controllers, connected with industrial networks, and supervised by humans.

The emphasis of this module is on the selection and determination of the individual components, bearing in mind functional aspects, with special attention to functional safety.

Aims, content, methods

Learning objectives and acquired competencies

The student will be able to :

- establish the specifications of an integrated mechatronic system, including the sensors, the actuators, and the control systems;
- master the operation of electric drives for automated processes; be able to choose a motor with its controls according to the applications;
- select and to integrate technologies of sensors according to applications;
- determine a suitable communication system for an automation task on the basis of functions and performance parameters;
- designate the evaluation criteria for the application of user interfaces;
- plan and size an Ethernet-based network;
- calculate comprehensive parameters (MTBF, MTTF, MTU...) on the basis of statistical data;
- complete a risk analysis

Contents of module with emphasis on teaching content

The module is divided in three courses:

1. *Drives and Sensors (ca. 35%)*
 - Functionality, calculation, and operational behavior of motors
 - Functionality and choice of sensors
 - Drive design and regulation
 - Decentralized drive systems
 - Application examples
2. *Communication and Networks (ca. 30%)*
 - Functionality and integration of automation components (bus systems, automation devices, communication modules, process control systems)
 - Networked automation technology
 - Service and monitoring systems, Human Machine Interface
 - Planning and the basic principles of project planning with Profinet / industrial Ethernet-based networks
 - Application examples
3. *Safety Engineering in Automation Technology (ca. 35%)*
 - Project planning for an error-proof automation system
 - Error-proof communication and programming
 - Remote diagnostics, elimination of errors, and remote maintenance
 - Application examples

Teaching and learning methods

- Lecture, presentations and discussion of theoretical topics
- Discussion of practical applications and examples from the industry
- Exercises and self-study of selected topics

Literature

The lecturers' scripts will contain references to current literature.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Familiarity with networking and TCP/IP

Basic knowledge in Python, HTML and JavaScript

Brief course description of module objectives and content

This course covers all the topics related to the Internet of Things: from the sensors level to the higher layer of data representation and manipulation. It is intended to give the student the technical knowledge and skills needed for building up an Internet of Things (IoT) system.

Aims, content, methods

Learning objectives and acquired competencies

Students attending this module

- have an overview of the IoT world: the technologies, application contexts, development strategies, implementation problems, and the possible solutions
- gain familiarity with the key technologies and protocols employed at each layer of the stack
- learn how to plan and implement real-world applications that involve heterogeneous devices
- Understand where the IoT concept fits within the broader ICT industry and possible future trends
- Appreciate the role of big data, cloud computing and data analytics in a typical IoT system

Contents of module with emphasis on teaching content

Part 1 (25%):

- Introduction to the Internet of Things
- Edge and gateway devices (microcontroller, sensors, and actuators)
- Communication technologies
- Communication protocols

Part 2 (30%):

- Embedded programming (Arduino, RaspberryPi)
- Deploy an IoT infrastructure

Part 3 (30%):

- Heterogeneous IoT devices integration
- Data acquisition, management, and mining
- IoT in the real world

Part 4 (15%):

- Connect the IoT infrastructure with the data world

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Optics: Basics of wave and geometrical optics; without optics basics during bachelor studies, the EVA "Fundamentals of light" should be visited before visiting further TSM modules.

Physics: Basics for engineers (bachelor niveau)

Brief course description of module objectives and content

TSM module "Laser and Laser applications" provides a broad overview about the fascinating field of state-of-the-art Laser technology and its applications in industry, R&D, medicine and communication. The modul provides a comprehensive insight into the Laser and applications market, Laser types and devices, Beam deliveries, Laser machines, Physics of interaction between laser and material, and real industrial application examples

presented by experts with industrial background. Module objective is to increase and enhance the technological competences on laser generation, control, and laser-material interaction.physical/ technological limits and competing technology.

Aims, content, methods

Learning objectives and acquired competencies

After successfully completing this course the student:

- knows the concepts of the most important laser types with their respective advantages and disadvantages and will be informed about future trends.
- will be skilled to decide between Laser-based technology or other manufacturing technology based on knowledge in technology, efficiency, economical, and ecological reasons
- knows industrial relevant beam guiding and delivery systems and technologies
- will be skilled to make decision on suitable laser source and beam delivery depending on application process.
- thoroughly understands important laser applications and can design the most relevant features of the systems required for them
- knows the most relevant physical effects which happen during the interaction between laser and material
- will be skilled to determine processing strategy, basic parameters and supporting technology
- knows basics methods of beam diagnostics, process monitoring, and industry 4.0 technology

Contents of module with emphasis on teaching content

Laser [7 weeks]

1. Basics [2 wk]
Repetition of basics, Resonators, Laser modes, etc.
2. Technical realization of Lasers [3 wk]
Design concepts of significant laser sources, Pulse generation, Wavelength conversion,
3. Beam Delivery and Optics [1 wk]
hard optics, fibers, working head concepts, beam forming, Scanners, fast and ultra-fast optics etc.
4. Laser Safety and health protection [1 wk]

Laser Applications [7 weeks]

1. Industrial Laser Applications [4 wk]Market description, Applications (Welding, Cutting, Drilling, Structuring, Hardening, Marking, Additive Manufacturing etc.), Laser – material interaction, parameters, process properties and limits, laser machine concepts
2. Lasers in Medicine, Measuring Technology, Communication and Science [2 wk]
Interferometry, Spectroscopy, Surgery, Ophthalmology, Displays and Communication, Microscopy

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

- Basic knowledge of logistics
- Basic knowledge in operations management
- Good knowledge of English

Brief course description of module objectives and content

The module starting from the analysis of the whole Supply Chain configuration and management process, underlines in particular the greater importance role that logistics and procurement are assuming in modern collaborative Supply Chain. Procurement is a strategic business driver that allows companies to efficiently focus on their key competences and activities while leveraging competences and cost advantage stemming from a

complex supplier network, which provides products and services. Logistics activities are crucial for modern Supply Chains, ensuring a smooth sharing of information and materials among manufacturers and their globalized supplier networks. Moreover, distribution logistics plays a crucial role in delivering customer experiences and value, thanks to differentiated options and services. The evolution of Supply Chain activities in reaction to new paradigms, such as sustainability and mass customization, and thanks to technological innovations, such as Industry and SCM 4.0, will be analysed in order to better understand future challenges and opportunities.

Aims, content, methods

Learning objectives and acquired competencies

The module prepares for a professional career in industrial Supply Chain Management (SCM). Possible fields of activity include business development, innovation, business processes and quality improvement, the management of Supply Chains at national and international level.

The module will provide the necessary knowledge to understand the variety of possible SCM concepts, including sourcing, logistics and outsourcing/offshoring. An overview of the potential alternatives will be achieved through the analysis and knowledge acquisition about strategies, management processes, structures and technical elements, based on the design principles of different operational procurement and distribution needs of multiple branches.

The students will be able to manage strategic, tactical and operational decisions; starting from the establishment of correct strategies suitable for given targets, design a possible operating strategy for the planned issues and implement at tactical and operational level the required coordination and management mechanisms. For this reason, methodological tools for deriving and implementing suitable strategies (understanding of the influence of the industrial sector context, establishment of realistic targets, identification of decision drivers and key processes, designing of suitable strategies, managing and controlling of internal processes and their integration with those of the supply chain partners) will be introduced.

In order to deepen the level of knowledge and competences, while dealing with practical aspects and comparison of alternatives, quantitative methods will be presented and applied by the students through examples and tasks. Case studies, presented by industrial and scientific experts, will allow to better understand the complexity linked to the application in real contexts of the proposed methodologies and to face these challenges. A group assignment will allow students to further appropriate specific topics, covering their analysis under different perspectives.

Contents of module with emphasis on teaching content

SCM integrates all activities involved in the flow of goods and services from providers to the final customers and is fundamental for achieving company success in a globalized, dynamic and uncertain business environment. The ability to react to customer requirements and matching them with the network resources is critically important in SCM and requires among other things focusing on core competences, making coherent outsourcing/offshoring decisions as well as choosing suitable configurations of the distribution network. Aside from those strategic considerations, decisions have to be made on the tactical and operational levels. The module will deal with models and concepts of international logistics, including sourcing and outsourcing/offshoring, e.g.:

- SCM strategy and internationalization including outsourcing/offshoring
- Contract management (statement of requirements)
- SCM management and controlling
- Models and concepts of international logistics including warehousing and transport
- Rules and regulations in international logistics
- Governance, Corporate Social Responsibility, and quality assurance in SCM

Under the umbrella provided by the macro areas listed above a variety of topics will be addressed, such as:

- SCM introduction (definitions, 7 principles, 8 key activities, etc.)
- Supply Chain design, configuration and coordination
- Sustainable SCM
- Decision Support Tools in SCM
- Risk Management in SCM
- Innovation in SCM (Industry and SCM 4.0, new services, etc.)
- International Logistics (air, sea, rail, road)
- Inter-modality
- Last Mile distribution and Omnichannel
- Procurement Strategy Development
- (Strategic) Sourcing Lifecycle
- Supply market competitiveness appraisal
- Supplier Relationship Management
- Outsourcing/Offshoring (and Insourcing/Nearshoring)
- Purchasing negotiation

Teaching and learning methods

- Lectures / presence
- Tutorial / presence
- Group assignment / self-study

Literature

- The presentations distributed by the lecturers will be the main source
- Specific scientific and “magazine” articles will be uploaded for covering specific topics and applications

Additional material for in-depth analysis can be found for instance in the following books:

- Logistics & Supply Chain Management, 5th Edition, Martin Christopher, 2016, Pearson Education
- Purchasing and Supply Chain Management: Analysis, Strategy, Planning and Practice, A.J. Van Weele, 2009, Cengage
- The Handbook of Global Outsourcing and Offshoring 3rd edition, I. Oshri, J. Kotlarsky, L.P. Willcocks, 2015, Palgrave

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Bonnes connaissances en analyse structurale, technologie des matériaux.

Brève description du contenu et des objectifs

Une grande partie des travaux futurs de construction se fera dans le bâti existant. Ce module apporte aux étudiant-e-s du master les méthodes et les procédés nécessaires dans la maintenance d'ouvrages.

Toute remise en état, modification ou renforcement d'ouvrages et d'infrastructures nécessite un relevé spécifique et fondé de l'état actuel. L'identification des dégâts et des outils appliqués, l'actualisation des informations y.c. l'évaluation de la capacité porteuse ainsi que les méthodes de réparation et de renforcement constituent les points de mire de la formation. Des exemples typiques tirés de la construction en béton armé et de la construction en bois servent de réflexion aux étudiant-e-s pour la découverte de la méthodologie et des spécialités.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiant-e-s acquièrent des compétences de base dans l'examen d'ouvrages existants. Pour ce faire, durant les cours magistraux, le déroulement et l'étendue d'un examen sont enseignées et le degré de détail nécessaire est abordé.

Les étudiant-e-s se familiarisent avec les méthodes d'auscultation usuelles (destructrices et non destructrices) pour le béton armé et le bois. Ils se voient dispensés pendant les cours des informations sur les applications et les limites de ces méthodes.

Les étudiant-e-s sont sensibilisé-e-s aux principaux mécanismes de dégradations et aux défauts usuels des constructions en béton armé et en bois, et ils acquièrent des connaissances sur l'analyse et l'évaluation structurales des structures existantes.

Les étudiant-e-s acquièrent des connaissances sur les procédés les plus courants de remise en état et de renforcement. Ces derniers sont enseignés à l'aide d'exemples pratiques de construction. Des exemples choisis pour les exercices permettront d'approfondir les connaissances acquises.

Contenu des modules avec pondération du contenu des cours

Le module est divisé en trois parties :

1. Bases théoriques (env. 10 %)

- Caractère et fonction du relevé de l'état / de l'examen d'ouvrages
- Principes d'une évaluation de l'état, degré de raffinement requis
- Procédure d'un relevé de l'état / d'un examen (préparation, exécution, appréciation, évaluation)

2. Construction en béton (env. 60%)

- Défauts, dommages typiques, causes des dommages, mécanismes de détérioration, étendue des dommages
- Méthodes d'auscultation non destructives et destructives
- Analyse et évaluation de l'état physique
- Analyse et évaluation de la sécurité structurale
- Méthodes d'intervention (remise en état et de renforcement)

3. Construction en bois (env. 30%)

- Défauts, dommages typiques, causes des dommages, mécanismes de détérioration, étendue des dommages
- Méthodes d'auscultation non destructives et destructives
- Analyse et évaluation de l'état physique
- Analyse et évaluation de la sécurité structurale
- Méthodes d'intervention (remise en état et de renforcement)

Méthodes d'enseignement et d'apprentissage

- Cours magistraux
- Discussion de cas pratiques
- Exercices et étude autonome de sujets sélectionnés

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Good knowledge of English.
Bachelor degree in Business Administration or Engineering.

Brief course description of module objectives and content

A proper understanding of the current state and probable future development of a market is key to any successful business development. The module Market Analysis and Forecasting provides the foundations of analysis of complex socio-economic systems. It puts students in place to autonomously plan, design and execute their own qualitative and quantitative analysis. Development of well-founded forecasts and scenarios completes the understanding of customer data, markets and the socio-economic environment. Tools for the definition and the analysis of company reactions to potential future market scenarios will complete the module, allowing for transformation of market inputs into strategic choices.

Aims, content, methods

Learning objectives and acquired competencies

Students have the knowledge and the ability to understand and analyze a market as a complex socio-economic system. They are able to identify the most relevant factors determining the market behavior, to identify the causal relation between these factors and to describe socio-economic systems by means of qualitative modelling. Students understand and apply key concepts of the theory of complex systems such as observability, controllability, time variance or invariance, randomness or determinacy of factors, linear or nonlinear, static or dynamic behavior and their impacts on the overall system behavior. Students apply qualitative and quantitative methods for model validation, including basic behavior analysis and statistics. In practical examples they learn to analyze, predict and steer such systems. Finally students are able to present the analysis results in terms of descriptive scenarios using different visualization techniques.

Contents of module with emphasis on teaching content

The module includes the following topics:

1. Market modelling

- Understanding the market as a complex, socio-economic system
- Outlook: system modelling in a broader context
- Identification of key factors determining the dynamic, time variant and stochastic behavior of a market
- Systemic market analysis
- Experiencing complex market behavior, steering complex systems
- From qualitative to quantitative models
- Model validation
- Developing scenarios describing the market future
- Prospects and limits of modelling

2. Case studies that cover topics in market analysis such as

- Customer segmentation for marketing campaign planning
- Customer feedback analysis for service improvement planning
- Demand prediction for electricity production planning and agricultural planning
- Credit card default prediction
- Applicant rating for HR decision making

using basic quantitative methods such as

- k-Means Clustering
- k-Means Clustering
- Linear Regression
- Logistic Regression
- Time Series Forecasting

The use and benefits of each discussed topic will be explained, methods for solving the analysis tasks will be presented in an accessible and non-technical manner. The focus will be on the validity and generalizability of the results/conclusions and how they will be included in decision making.

Teaching and learning methods

The module is taught by theory inputs, case studies and a software tool.

TSM Technisch-wissenschaftliche Vertiefung

Lektionen

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

- Kenntnisse der Baustatik von Stabtragwerken und Flächentragwerken sowie Kenntnisse der Bemessung und Konstruktion von Tragwerken aus Stahlbeton und Stahl.
- Kenntnisse von Bodenmechanik sowie von Berechnung und Dimensionierung geotechnischer Tragwerke.
- Kenntnisse der Matrixalgebra und der Differentialgleichungen.

Kurzbeschreibung der Inhalte und Ziele

1. Inhalte: Einführung in Kontinuum-Mechanik und in Plastizitätstheorie, Analyse der Stoffgesetze für Boden und Baustoffe im Bereich des konstruktiven Ingenieurbaus; Anwendung der Plastizitätstheorie für Traglastberechnungen in der Geotechnik sowie im konstruktiven Ingenieurbau
2. Ziele: Nach diesem Modul sollen die Studierenden ein vertieftes Verständnis über die Stoffgesetze von Boden sowie von Baustoffen im konstruktiven Ingenieurbau entwickeln und fähig sein, diese Stoffgesetze korrekt in der Berechnung der Traglast für konkrete Bauwerke anzuwenden. Zudem sollen die Studierenden die Methoden für Berechnung des Tragvermögens mittels Plastizitätstheorie in der Geotechnik sowie im konstruktiven Ingenieurbau verstehen und in geeigneten praktischen Aufgaben anwenden können.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Lernziele und zu erwerbende Kompetenzen:

Nach diesem Modul sollen die Studierenden:

- a) ein vertieftes Verständnis über die Stoffgesetze von Boden sowie von Baustoffen im konstruktiven Ingenieurbau entwickeln
- b) korrekt einschätzen können, welcher Stoffgesetz in welcher Situation in der Praxis anzuwenden ist
- c) Sinn und Zweck des Traglastverfahrens und der Grenzwertsätze in der Plastizitätstheorie verstehen
- d) Methoden für Berechnung des Tragvermögens mittels Traglastverfahrens in Geotechnik sowie im konstruktiven Ingenieurbau verstehen und anwenden können
- e) Stoffgesetze für Berechnung des realitätsnahen Tragvermögens für geotechnische Bauwerke sowie für Bauwerke im konstruktiven Ingenieurbau anwenden können
- f) Resultate der Berechnungen des Tragvermögens verstehen und plausibilisieren können

Modulinhalt mit Gewichtung der Lehrinhalte

1. Einführung in Kontinuum-Mechanik und Werkstoffmechanik (insgesamt ca. 35%):

- Einführung in statische und kinematische Beziehungen; Einführung in Werkstoffbeziehungen (linear-elastisches, ideal-plastisches Verhalten, plastisches Potential, Fließbedingungen) (ca. 10%)
- Stoffgesetze für Boden (Elastizität; Versagenskriterien und plastisches Fließen, Verfestigung, Critical State) (ca. 15%)
- Stoffgesetze für Baustoffe im konstruktiven Ingenieurbau (Stahl, Stahlbeton, Faserbeton, UHFB, Glass) (ca. 10%)

2. Anwendung der Plastizitätstheorie im konstruktiven Ingenieurbau (insgesamt ca. 40%):

- Grenzwertsätze der Plastizitätstheorie
- Elastisch-plastische Systeme
- Traglastverfahren für Stabtragwerke inkl. konkrete Beispiele: statische und kinematische Methode
- Traglastverfahren für Flächentragwerke inkl. konkrete Beispiele: einfache Momentenfelder, Fließgelenklinien und Streifenmethode

3. Anwendung der Plastizitätstheorie und des nicht-linearen Materialverhaltens in der Geotechnik (insgesamt ca. 25%):

- Ausgewählte Fallbeispiele geotechnischer Problemstellungen aus der Praxis (Stützmauern, Hangstabilität, Flachgründungen, tiefe Ausgrabungen)

Lehr- und Lernmethoden

- Frontalunterricht und seminaristischer Unterricht
- selbstständige Übungen

Fundamentals of Material Science

Mechanics of Materials

Brief course description of module objectives and content

Materials offer immense opportunities for innovation. However, advance is possible only if a procedure exists for making a rational choice from the materials and a method of identifying ways to shape, join, and finish them.

The objective of this course is to develop a systematic procedure for selecting materials and processes, leading to the subset that best matches the requirements of a design. The structure gives rapid access to data and allows the user great freedom in exploring potential choices. The method is

implemented in the GRANTA CES EduPack software to provide greater flexibility: it enhances the learning experience and provides a solid grounding in many of the domains of expertise specified by the various professional engineering accreditation bodies (analysis of components, problem-solving, design and manufacturing , economic, societal and environmental impacts).

Aims, content, methods

Learning objectives and acquired competencies

Understand the importance of material property charts

Understand the method for material selection and design

Understand the concept of effective properties and their dependence on phase spatial arrangement in hybrid materials.

Learn the manufacturing techniques of hybrid materials.

Contents of module with emphasis on teaching content

The course content will be focused on:

- Material property charts
- Material selection and design
- Examples of hybrid materials and their applications
- Hybrid materials processing

Development of an hybrid material

Teaching and learning methods

Teaching: Ex cathedra teaching (theory),

Laboratory exercise with GRANTA CES EduPack.

Learning methods: Self study

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

The course requires knowledge of general physics, general chemistry and mathematics. Basic knowledge of the materials science of metals, ceramics and organic materials is also necessary.

Brief course description of module objectives and content

The interdisciplinary field of materials science and engineering covers approaches to improving the synthesis of new materials, to understanding their surfaces and main properties and, in particular, to adapting their properties to meet special requirements. The aim of this course is to teach students the fundamental principles necessary to understand the relationships between structure and property in material development.

Aims, content, methods

Learning objectives and acquired competencies

Students acquire comprehensive knowledge about the use of modern materials and their properties. Where appropriate, state-of-the-art problems are covered in the form of examples. Students understand the concepts of the structures, from bonding through to the microstructure and then learn to consider the correlations between structure and property. Examples are also presented for discussing how to influence these relationships between structure and property in the development of materials.

The aims of the course are as follows:

- Teaching students the fundamental mechanisms of materials science and materials technology.
- Teaching students the basic concepts regarding the correlations between structure, properties and processing of all the different material classes.
- Teaching students the importance of quantifying and characterising properties and phenomena

Contents of module with emphasis on teaching content

- Metals superalloys, shape memory alloys: properties and applications, methods for increasing strength, designing with metals
- Ceramics: classes, types, properties and applications, production technologies, additives, inorganic and organic glass types: classes, types and applications, production technologies
- Polymers: production, modification through additives, shaping; structure/property relationships and test methods; ageing and wear phenomena
- Composites: material properties, design methods
- Surface technology, coating and coating methods: functional coatings, thermal spraying processes, CVD, PVD, surface modifications
- Tribology: friction and wear, wear mechanisms, analysis methods, selection of wear-resistant materials and coatings

Teaching and learning methods

- Frontal teaching
- Presentation and discussion of case studies
- Private study:
 - study of specialist books and texts.
 - analysis of case studies

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Le cours présuppose des connaissances en physique générale, chimie générale et mathématiques. En outre, des connaissances de base sont prérequis en sciences des matériaux, telles que sur les métaux, les céramiques et les matériaux.

Brève description du contenu et des objectifs

Le champ pluridisciplinaire des sciences et ingénierie des matériaux dresse un aperçu des approches visant à améliorer la synthèse des nouveaux matériaux, comprendre leur surface et leurs principales propriétés, concevoir des caractéristiques spécifiques aux besoins. L'objectif de ce cours est de présenter aux étudiants les principes fondamentaux qui leur permettront de comprendre les relations entre structure et propriété en ingénierie des matériaux.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants se voient dispenser des connaissances approfondies dans le domaine de l'application des matériaux modernes et de leurs propriétés de conception. Le cas échéant, les problématiques de pointe sont abordées sous forme d'exemples. L'étudiant se familiarise avec les concepts de structure, de la mise à la masse à la microstructure, et apprend à considérer les relations d'interdépendance qui existent entre structure et propriété. En outre, des exemples sont présentés pour permettre de discuter de la manipulation des relations entre structure et propriété en termes d'ingénierie des matériaux.

Les objectifs du cours sont:

- Enseigner aux étudiants les mécanismes fondamentaux des sciences et technologie des matériaux.
- Les familiariser avec les concepts de base en termes d'exploitation des relations entre propriété et structure pour toutes les classes de matériaux.
- Sensibiliser les étudiants à l'importance de la quantification et caractérisation des propriétés et phénomènes.

Contenu des modules avec pondération du contenu des cours

- Métaux, superalliages, alliages à mémoire de forme: propriétés et applications, méthodes de renforcement, conception sur métal
- Céramiques: classes, types, propriétés et applications, technologies de production, additifs
- Verres inorganiques et organiques: classes, types et applications, technologies de production
- polymères: synthèse, modification par additifs, procédés de moulage, structure chimique contre propriétés chimiques et méthodes de test; processus de vieillissement et de dégradation
- matériaux composites: propriétés matérielles, méthodes de conception
- technologie de surface, revêtement et méthodes de revêtement: revêtements fonctionnels, vaporisation thermique, dépôt chimique en phase vapeur, dépôt physique en phase vapeur, modification de surface
- tribologie: frottement et usure, mécanismes d'usure, méthodes d'analyse, sélection de matériaux et revêtements résistants à l'usure

Méthodes d'enseignement et d'apprentissage

- Enseignement ex cathedra
- Présentation et discussion des études de cas
- Etude autonome:
 - Etude de manuels et publications
 - Analyse des études de cas

Bibliographie

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Connaissances de base de la mécanique des structures: Traction/pression, torsion d'ondes, flexion et déformation élastique de poutres, états de contraintes multiaxiales, tenseur de contraintes, contraintes comparables, preuve de stabilité en cas de sollicitations au repos et résistance à long terme
- Calculer avec des matrices

Brève description du contenu et des objectifs

Dans ce module, les étudiants acquièrent des méthodes de calcul permettant de prouver la capacité portante des structures et apprennent les limites d'application de ces théories.

Le module contient des méthodes et des démarches de calculs et de mesures du comportement mécanique des structures et met en évidence l'importance de ces méthodes pour le développement de structures portantes.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Les étudiants acquièrent la connaissance théorique dans des domaines sélectionnés de la mécanique des structures, pour résoudre des problèmes liés au développement de produits notamment en ce qui concerne les cycles de vie des produits.
- Les étudiants connaissent les mécanismes de défaillance d'ouvrages porteurs soumis à des pressions mécaniques et connaissent les possibilités ainsi que les limites dans le dimensionnement et l'agencement des structures.
- Les étudiants connaissent des lois élargies et sélectionnées sur les matériaux, par exemple le comportement élastoplastique, les matériaux anisotropes etc.

Contenu des modules avec pondération du contenu des cours

- Etat de contrainte / déformation spatiale et plane, comportements contrainte-dilatation élastiques et élastoplastiques de matériaux isotropes, comportements contrainte-dilatation de matériaux anisotropes.
- Critères de rupture (de Mises, Tresca) et critères d'endommagement pour des matériaux anisotropes. Critères pour des défaillances en fatigue, contraintes nominales et locales, procédé de comptage pour l'élaboration de spectres de charge, accumulation d'endommagement linéaire, durcissement plastique et multiaxiale, limite d'endurance en fatigue à court terme et en cycles lents
- Facteurs d'intensité de la contrainte, ténacité des fissures, déformations microplastiques à la pointe de la fissure, propagation de la fissure
- Mesure des contraintes mécaniques
- Stabilité de poutres et de plaques, comportement de portance en état bosselé; effondrement

Méthodes d'enseignement et d'apprentissage

- Cours magistral
- Démonstrations
- Etudes de documents spécialisés
- Exercices

Bibliographie

- Polycopié du cours
- Différents chapitres de la littérature spécialisée

Compétences préalables

Connaissances préalables, compétences initiales

Connaissances de base en:

- Mécanique (p.ex.: Conception mécanique détaillée: A Practical Guide (Guide pratique), J. Skakoon, 2000),
- Modélisation de systèmes mécaniques simples (p. ex.: <http://ipsa.swarthmore.edu/Systems/MechTranslating/TransMechSysModel.html>),
- Circuits électriques et composants (p. ex.: Basic Circuit Theory Théorie de base des circuits (Prentice-Hall Computer Applications in Electrical Engineering Series Des applications informatiques dans les séries d'ingénierie électriques) Oct 1990 par Lawrence P. Huelsman),
- Les fondements de la programmation (p. ex.: Programming: Apprendre les bases des langages de programmation informatique (Swift, C++, C#, Java, Coding, Python, Hacking, tutoriels de programmation) (Volume 1) cahier souple – Août 16, 2016 par Marc Rawen).

Brève description du contenu et des objectifs

Aujourd'hui, la plupart des biens de consommation et de production sont fabriqués en grande quantité dans des usines hautement automatisées pour ensuite être livrés aux consommateurs via des plateformes logistiques et de distribution. D'un point de vue technologique, les systèmes de production reposent sur des équipements de contrôle reliant les systèmes de commande automatiques, basés de nos jours sur des logiciels, aux capteurs et aux éléments mécaniques des machines. Ces systèmes complexes sont conçus et décrits à travers une combinaison de systèmes informatiques, électroniques et mécaniques, appelés des systèmes mécatroniques. Malgré le fait que les machines de production sont souvent très spécialisées, on peut identifier des points communs entre les solutions mécatroniques de différentes machines, en considérant certaines tâches principales (p. ex.: transporter, élever, positionner, enrouler) afin de classer et de décrire d'une façon générale (qui n'est pas propre à une application spécifique). Sur la base de cette analyse, des exigences peuvent être définies pour la configuration des composants (moteur, onduleur, réducteur) ainsi que pour les fonctions logicielles en vue de permettre une conception et une réalisation rapide et fiable.

Même les paradigmes de production en pleine ascension, faisant intervenir des approches alternatives à la production de masse traditionnelle (comme les systèmes de fabrication additive, les usines en réseau), fonctionnent grâce à des systèmes fortement automatisés et peuvent être composés d'un côté comme des combinaisons des mêmes types de tâches principales physiques, et d'un autre côté, comme une combinaison plus étroite et organique d'informatique et de mécanique (souvent considérée comme des systèmes cybernétiques physiques). De ce point de vue, le cours offre une vue d'ensemble de certains éléments clés de l'initiative Industrie 2025 ainsi que d'autres approches liées (Industrie 4.0, usine du futur, usine intelligente...)

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Analyser les exigences de l'utilisateur final des usines de production et leur impact sur les systèmes mécatroniques
- Concevoir des systèmes d'entraînement pour des processus automatisés avec une approche mécatronique
- Mettre en œuvre des méthodes et des outils pour une modélisation et une conception cohérentes des systèmes de manufacturing et de production
- Être capable de sélectionner les composants industriels correspondant aux spécifications de la conception

Contenu des modules avec pondération du contenu des cours

Le contenu du module couvre tout l'éventail de la mécatronique pour montrer son importance et répondre à toute l'étendue des domaines de production et de la logistique. Durant les cours, l'accent sera mis sur les méthodes et les outils mécatroniques mais tous les sujets présentés ne seront pas abordés avec le même niveau de précision.

- Comment les systèmes de production et de logistique sont structurés
- Représentation UML des exigences mécatroniques
- Les machines dans la production et la logistique
- Concepts généraux des systèmes mécatroniques
- Éléments d'entraînement et de mesure mécatroniques
- Fiabilité des systèmes mécatroniques
- Transporteurs et élévateurs
- Entraînement des systèmes non commandés, en boucle ouverte
- Systèmes de positionnement et capteurs pour les systèmes migrants
- Cames électroniques et systèmes multi-axes
- Entraînement des processus de fabrication
- Choisir et dimensionner des systèmes d'entraînement pour les machines-outils (p. ex. mixer, fraiser, broyer...)
- Utilisation d'OpenModelica pour modéliser et simuler des systèmes mécatroniques

Méthodes d'enseignement et d'apprentissage

Cours, exercices et un projet de classe annoncé lors du premier cours, consistant en un exemple réaliste basé de préférence sur une expérience industrielle

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Basics in maths, physics, electricity of BSc engineering programs or similar

Brief course description of module objectives and content

This module gives an introduction to the physical and technical principles and applications of important diagnostic modalities. Starting with an overview of clinically used modalities and their applications, technical requirements and limitations based on the fundamental principles will be discussed. Furthermore, efficient methods for biomedical signal processing and analysis are introduced.

Aims, content, methods

Learning objectives and acquired competencies

Upon completion of the module, the student will be able to

- gain knowledge in fundamentals of chemical, biological and physical sensors
- achieve basic knowledge in the design of sensor systems
- apply sensors and systems in medical diagnostics
- apply signal processing methods on biosignals for diagnostic purposes
- achieve basic signal processing skills to perform artifact removal, feature extraction, and classification on biological signals.
- explain fundamental principle of medical imaging modalities
- achieve basic knowledge of the most important clinical application of medical imaging modalities
- describe approaches and methods for image quality assessment

Contents of module with emphasis on teaching content

Part 1 Devices & Sensors: Overview of diagnostic instrumentation and modalities:

Generation of X-ray, X-ray detectors, technology and application of Fluoroscopy, CT, PET / SPECTMRI, diagnostic ultra sound; image-guided therapy (interventional radiology, IGRT, theranostics);

Image quality, radiation protection and QA for diagnostic devices,

Chemical, biological, and physical sensors, design requirements for sensors and devices in diagnostics, sensor application in medical diagnostics (ECG, EEG, EMG, optical pulseoxymetrie, (Blood)pressure, flow sensor, otoacoustic emission (OAE), etc.)

Part 2 Signal processing

Measurement in medical diagnostics, amplifier, signal conversion and quantization

Standard methods for biomedical signal processing and analysis, Imaging processing

- Background on time- and frequency-domain characteristics of particular biosignals and common artifacts
- Techniques for artefact removal, event detection, feature extraction, pattern recognition, classification

Teaching and learning methods

Presentations, Excercises and Labs

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

This course requires knowledge about

- technical design methods
- mathematical statistics/data analysis
- basic organic chemistry

Brief course description of module objectives and content

The course provides an in-depth overview on all relevant aspects for successfully introducing a medical device into the market. The corresponding topics include the important tasks during the development of a medical device (prior market access) as well as after its placement on the market.

Aims, content, methods

Learning objectives and acquired competencies

The aim of this lecture is to

- know the important medical device design principles
- know all relevant aspects for the development of a medical device with respect to a successful market placement
- understand the regulation for medical devices in Europe (MDR) and USA (FDA)
- apply current standards for (software) design, risk management, usability and/or biological aspects

Contents of module with emphasis on teaching content

14 different topics related to the market access of a medical device will be presented each week as follows:

- (1) From lab bench to bed side: medical device design principles.
- (2) Understanding compatibility of materials according ISO 10993.
- (3) Basic knowledge in microorganisms and pathogens (including ISO14644/clean room).
- (4) Knowledge of cleaning and disinfection processes of medical products as well as sterilization procedures and methods. In addition, overview on the packaging of sterile products.
- (5) Understanding the scientific language of medicine, the research culture as well as the ethical aspects in the context of medical devices.
- (6) Knowledge of the classification of medical products and the requirements of EU-MDR and US-FDA.
- (7) Insights into the quality management system EN ISO 13485:2016.
- (8) Knowledge of the CE-labelling in Europe and registration procedure in the USA. Product labelling (ISO 15233) and UDI.
- (9) Overview on the legal requirements on the design and construction of medical products. This includes the requirement management as well as the verification and validation of development results including the Software Life Cycle (ISO 62304).
- (10) Knowledge of the legal requirements on producers of medical products in Europe and elsewhere.
- (11) Introduction into the clinical testing of medical devices and basic knowledge of "good clinical practice" (including ISO 2859 and ISO 3951).
- (12) Understanding the basics in the usability according EN 62366, validation of the usability.
- (13) Understanding the risk management according ISO 14971 and having insights into the risk analysis.
- (14) Overview on the markets, health systems and the decision makers when it comes to acquiring new medical products.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Students have working knowledge in:

- Programming in Java
 - Software development and frameworks
 - Desktop or mobile user interface development
 - Internet protocols, HTTP and sending Web requests
- Students bring a laptop to class.
 - Students bring an Android phone to class (if possible).

Brief course description of module objectives and content

This module enables students to develop advanced, native applications for the Android mobile operating system and get a solid understanding of mobile computing concepts. Building on the basics of mobile application development, this course covers a selection of application programming interfaces for on-board sensors and connectivity options for the integration with backend services, IoT platforms and peripheral devices. Lecturers share their experience and best-practices from recent projects involving mobile computing. Students work with both emulators and real devices.

Aims, content, methods

Learning objectives and acquired competencies

Application Development (50%)

- Students know how to design and implement native applications for mobile devices running Android, the most widely used mobile platform.
- Students have basic knowledge of user-interface design guidelines and techniques relevant for mobile application design.
- Students can describe the integration of their application with a backend Web service.

Sensors and Connectivity (50%)

- Students know how to use on-device sensor APIs for motion, position and environment.
- Students have basic knowledge of connectivity options like Near Field Communication (NFC), Bluetooth Low Energy (BLE) and Wi-Fi.
- Students can describe the integration of their application with a peripheral device or IoT platform using request/response or messaging protocols.
- Students have basic knowledge of prototyping a peripheral IoT device with an Arduino-compatible hardware platform, sensors and actuators.

Contents of module with emphasis on teaching content

Application Development

- Development of native mobile applications for Android, including user interfaces
- Specific aspects in mobile application programming such as application lifecycle, data storage, data synchronization with servers and cloud services, security / sandboxing of mobile applications and power management.

Sensors and Connectivity

- Development with on-device sensor APIs for motion, position and environment.
- Specific aspects of connecting to peripheral devices with connectivity options like NFC, BLE and Wi-Fi, prototyping an IoT device and integration with IoT platforms.

Teaching and learning methods

- Ex-cathedra teaching
- Mini-projects
- Exercises
- Self-Study

Catégorie de module

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Les étudiants ont des connaissances préalables dans

- les systèmes d'ordinateurs, les processeurs, les systèmes bus, les concepts de systèmes d'exploitation
- la programmation en Java
- programmation réseau asynchrone
- le développement de logiciels et de frameworks
- le développement d'interfaces d'utilisateurs pour ordinateur de bureau

Les étudiants apportent en classe un ordinateur portable qui leur permet de faire des exercices pratiques en iOS avec l'IDE XCode (le cas échéant). Les étudiants apportent en classe un téléphone Android qui leur permet de démontrer sur cet appareil le résultat de leur mini-projet.

Brève description du contenu et des objectifs

Ce module permettra aux étudiants de travailler avec des plateformes et des systèmes d'exploitation mobiles comme Android, et/ou iOS (iPhone/iPad) et de comprendre rapidement la conception d'applications sur d'autres plateformes. Outre une révision sur les systèmes d'exploitation et des outils de programmation de ces plateformes, ce cours fournira les connaissances de base nécessaires pour le développement d'applications mobiles. Les enseignants partageront leur expérience et les meilleures pratiques dans le développement de projets récents. Les étudiants travailleront avec deux environnements : de simulation et d'appareils / téléphones réels.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Systemes d'exploitation mobiles :

- Les étudiants peuvent décrire leur architecture et leurs fonctionnalités.
- Les étudiants peuvent expliquer leurs mécanismes spécifiques.
- Les étudiants savent comment utiliser les plateformes de développement d'applications les plus courantes.

Applications

- Les étudiants ont les connaissances de base pour concevoir et implémenter les applications sur des appareils mobiles exploitant des plateformes comme Android et/ou iOS.
- Les étudiants savent comment utiliser des fonctionnalités spécifiques aux plateformes incluant un dispositif de capteurs (géolocalisation, accéléromètre, etc.) et les interfaces APIs vers le Cloud.
- Les étudiants ont des connaissances de base sur les principes et techniques de conception d'interface utilisateur spécifique aux applications mobiles.

Contenu des modules avec pondération du contenu des cours

Systemes d'exploitation :

- Architecture et mécanisme de systèmes d'exploitation pour appareils mobiles (vue d'ensemble, architecture, séquençement, mémoire et sécurité)

Applications

- Développement d'applications mobiles en réseau
- Développement d'interfaces d'utilisateur pour des applications mobiles (principes d'utilisabilité et conception orientée utilisateurs)
- Les aspects spécifiques de la programmation comme le cycle de vie de l'application, utilisation de capteurs, stockage de données, synchronisation des données avec les serveurs et les services du Cloud, sécurité / contexte (« sandbox ») d'applications mobiles et gestion de la consommation.
- Développement multiplateforme (en option).

Méthodes d'enseignement et d'apprentissage

- Cours magistral
- Mini-projets
- Exercices
- Autoformation

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

The students are expected to have knowledge on a basic level in:

- Descriptive statistic
- Aviation in general

Brief course description of module objectives and content

The course will focus on operational and infrastructure topics and the optimization of complex systems in terms of delay, capacity issues and future developments in aviation.

Future developments and important upcoming topics in the airline industry will be addressed, such as unmanned aircraft systems, new approaches in business models or passenger operations.

Aims, content, methods

Learning objectives and acquired competencies

The students will be able to understand state-of-the-art methods for operations in aviation in general but also new methods e.g. machine learning, deep learning and different approaches in meta-heuristic optimization.

Obtain the ability of modelling and simulation of resources (crews, fleets, passengers) for network planning, data processing and capacity issues.

Improving the presentation competencies to report complex modelling results to the decision makers. Achieving the ability to apply "what has been learnt" to future developments.

The students will learn how to design and plan infrastructures and operation in terms of capacity, delay management, and revenue managements.

Students will be able to assess future developments in the airline industry, classify them and react appropriately.

Contents of module with emphasis on teaching content

The course starts with a brief introduction in the infrastructural set-up of aviation systems in terms of capacity, demand and operational issues.

Basic concept in operation management will be briefly repeated, which then are used to deepening the knowledge for important topics such as capacity planning, airline transport management, airline revenue management, and overall mathematical optimization methods.

The last part of the course will be dedicated to the future development in the airline industry with a focus on operational methods, upcoming transport techniques and new infrastructure approaches.

Teaching and learning methods

- Lectures
- Self-study
- Run simulations under supervision and in small self-study projects
- Work on weekly exercises with oral presentations in front of the class
- Analysis of case studies
- Scientific paper studies and online research

Lektionen

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

- Grundlegende Kenntnisse / Basiskenntnisse in Landschaftsarchitektur und Raumplanung
- Grundlegende Kenntnisse in den Problemstellungen der Nachhaltigkeit

Kurzbeschreibung der Inhalte und Ziele

Ressourcenknappheit, Klimawandel, aber auch neue Strategien des Bundes (z.B. Biodiversitätsstrategie) verlangen zukünftig verstärkt den Einbezug der Nachhaltigkeit bei Planungs- und Entwurfsprozessen.

Im Modul wird mittels Beispielen aus der Praxis die Berücksichtigung der Nachhaltigkeit bei der Planung und Realisierung von Projekten der Landschaftsarchitektur (Landschaftsplanung, Freiraumentwurf) und der Raumplanung erörtert.

Mit den Studierenden werden wirksame Ansätze, die zu nachhaltigeren Projekten führen, behandelt und im Rahmen der Übungen anhand von ausgewählten, konkreten Vorhaben angewendet.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Fachliche Ziele:

- Kenntnisse von Methoden, Instrumenten und Massnahmen, die zur systematischen Berücksichtigung der Nachhaltigkeit in Projekten in der Landschaftsarchitektur und in der Raumplanung führen. Damit haben Sie die Kompetenz, die Bearbeitung neuer Aufgabenstellungen mit den dafür geeigneten Mitteln anzugehen.
- Kenntnisse über die aktuelle Praxis sowie die Kompetenz, neue Aufgabenstellungen an Best-Practice zu messen und dementsprechend anspruchsvolle Prozesse in die Wege zu leiten.
- Kompetenz, gegenüber Spezialisten in Teilgebieten der Nachhaltigkeit kommunizieren zu können.

Methodische Ziele:

- Fähigkeit, unterschiedliche Anforderungen beteiligter Akteure zu systematisieren und in einem übergeordneten Planungsprozess einzubinden und wirksam zu machen.
- Fähigkeit, in komplexen Aufgaben zum Thema Nachhaltigkeit, zielführende Aufgaben (oder Teilaufgaben) und konkrete Massnahmen an spezialisierte Beteiligte zu delegieren.

Modulinhalt mit Gewichtung der Lehrinhalte

- Einführung
- Teil 1: Theorien und Methoden des nachhaltigen Vorgehens in den Bereichen Landschaftsarchitektur und Raumplanung
- Teil 2: Praxisnahe Instrumente und Massnahmen zur Optimierung von Projekten der Landschaftsarchitektur und Raumplanung bezüglich der Nachhaltigkeit

- Einführung / Theorien und Methoden der Nachhaltigkeit in Planungs- und Entwurfprozessen: 3 Wochen
- Instrumente und Massnahmen zur Nachhaltigkeit in der Raumplanung: ca. 3 Wochen
- Instrumente und Massnahmen zur Nachhaltigkeit in der Landschaftsarchitektur: ca. 6 Wochen
- Kennenlernen von Best Practice im Rahmen von Exkursionen: 2 Wochen

Lehr- und Lernmethoden

- Vorlesungen (2 Lektionen pro Woche)
- Übungen (1 Lektion pro Woche)

Bibliografie

Checklisten / Richtlinien / Empfehlungen von Organisationen wie SIA, KBOB, eco-bau, Netzwerk Nachhaltiges Bauen NNBS, usw.; Unterlagen von Best Practice - Beispielen

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

- Hydraulik und Hydrologie
- Grundlagen des konstruktiven Wasserbaus
- Bodenmechanik und Geotechnik
- Grundlagen der Baustatik und des konstruktiven Ingenieurbaus

Kurzbeschreibung der Inhalte und Ziele

Das Modul behandelt die wichtigsten meteorologischen-hydrologischen sowie gravitativen Naturgefahren. Neben der Auseinandersetzung mit einzelnen Gefahren (Entstehung, Gefährdungsbilder, Analysen, Massnahmen) werden auch das integrale Risikomanagement sowie rechtliche Aspekte und Haftungsfragen behandelt.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

- Die Studierenden können Ursachen und Entstehung der für die Schweiz wichtigen Naturgefahren in eigenen Worten detailliert beschreiben und analysieren.
- Die Studierenden können selbständig neues Wissen aneignen und ihre Arbeit überzeugend präsentieren.
- Die Studierenden erkennen mögliche Gefahren und daraus resultierende Schadensbilder und können beurteilen, welche Massnahmen geeignet sind, um diese in Zukunft zu vermeiden. Sie können den Kreislauf des integralen Risikomanagements auf ein Fallbeispiel anwenden und die Gefährdung, Verletzlichkeit und den Verlustwert beurteilen.
- Die Studierenden kennen die Gesetze und Verordnungen im Zusammenhang mit Naturgefahren. Sie verstehen den Zusammenhang zwischender Raumplanung und Naturgefahren und wissen, wo die Raumplanung ansetzt.
- Die Studierenden kennen den Aufbau der Gefahrenkarten und können diese an Fallbeispielen umsetzen.

Modulinhalt mit Gewichtung der Lehrinhalte

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Hydraulique Hydrologie
- Connaissances de base en construction hydraulique
- Mécanique des sols et géotechnique
- Connaissances de base en statique de la construction

Brève description du contenu et des objectifs

Le module traite des principaux dangers naturels gravitationnels et météorologiques. Mis à part la réflexion sur différents dangers naturels (origine, scénarios de risques, analyses, mesures), le cours accorde aussi une importance centrale à la gestion intégrée du risque, aux aspects juridiques et aux questions de responsabilité.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- Les étudiant-e-s sont en mesure de décrire de manière détaillée la cause et l'origine des principaux dangers naturels en Suisse ;
- Les étudiant-e-s sont en mesure d'acquérir par eux-mêmes de nouvelles connaissances dans le domaine des dangers naturels et de présenter leurs travaux de manière convaincante ;
- Les étudiant-e-s identifient les dangers gravitationnels possibles, ainsi que les dommages qu'ils provoquent, et sont à même d'estimer les mesures indiquées pour les prévenir. Ils/elles appliquent la gestion intégrée du risque dans une étude de cas ; ils/elles évaluent le risque, la vulnérabilité et la valeur de la perte ;
- Les étudiant-e-s connaissent les lois et les ordonnances concernant les dangers naturels. Ils/elles comprennent le lien entre l'aménagement du territoire et les dangers naturels, et connaissent les procédures d'aménagement existantes ;
- Les étudiant-e-s sont capables de concevoir et de réaliser une carte des dangers en partant d'une étude de cas.

Contenu des modules avec pondération du contenu des cours

Aperçu des principaux dangers naturels

- Dangers hydrométéorologiques, dangers gravitationnels

Gestion intégrée du risque (env. 20%)

- Processus de la gestion intégrée du risque
- Analyse, évaluation et réduction de risque

Aspects juridiques et questions de responsabilité (env. 10%)

- Lois et ordonnances

Mise en commun des connaissances (env. 10%)

Aménagement du territoire et zones de protection (env. 10%)

- Carte d'indication des dangers, carte des dangers, différenciation des objectifs de protection
- Plan d'affectation, permis de construire

Dangers hydrométéorologiques, dangers gravitationnels (env. 50%)

- Bases physiques, causes, incidences, scénarios de risques, mesures, outils de modélisation pour :
 - Inondations
 - Coulées de boue
 - Chutes de blocs (instabilités rocheuses)
 - Glissements de terrain
 - Pergélisol
 - Avalanches
 - Tremblements de terre

Méthodes d'enseignement et d'apprentissage

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Internet protocols

Basic concepts of networking protocols.

Brief course description of module objectives and content

The new trend in multimedia and communication requires new paradigms in terms of both mobility and security. This module gives an overview of the classical network architectures, the new techniques which took advantage of the latest findings in terms of technologies and algorithms.

The module will present the latest technologies and the scientific background to the main topics like:

- Mobility and virtualization of IP networks
- Self organizing networks
- Next Generation Networks

Presentation of real, representative infrastructures offering high complexity, performances and service level.

Aims, content, methods

Learning objectives and acquired competencies

At the end of this module, the student has the following knowledge:

- the new architectures and trends in the IP networks
- ability to describe the main features of each of these architectures and to compare them with each other
- characteristics of mobility systems and their impact on networking architectures
- ability to participate in the planning, development and operation of innovative networking infrastructures.

Contents of module with emphasis on teaching content

Mobility and virtualization in the IP networks (about 30%)

Mobility in the IP networks: Mobility / IP mobility issues in a cellular network / Mobility at IP / MIP (Mobile IP) / Mobility with IPv6 level

Virtualization of IP networks: VPN (Virtual Private Network) / MPLS (Multi-Protocol Label Switching) / Remote Access / AAA (Authentication, Authorization, Accounting).

Traffic planning and quality of service in the IP networks,

Data transport protocols and security.

Self-organized networks (about 20%)

P2P networks

Localization techniques

authentication,

Applications and Examples of Networks (SDN - Software Defined Network, Cloud, etc.).

Next generation IP networks and IP access technologies (NGN: Next Generation Networks) (approximately 50%)

Architecture IMS / TISpan,

Control and transport protocols for multimedia,

Public and private identities, reception, authentication,

General mobility: roaming and relocation,

Network and application security,

IP access and backhaul.

5G networking and IoT systems.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Solid knowledge in physics, thermodynamics and mathematics.

Brief course description of module objectives and content

Description of numerical methods and application in building thermodynamics and heat transfer. Modelling complex heat transfer through building construction and for modelling air movement outside and inside the building. Numerical methods for fire simulations. Modeling and solving practical problems in different fields of building engineering.

Aims, content, methods

Learning objectives and acquired competencies

1. Introduce the fundamentals of numerical methods used for the solution of engineering problems.
2. Improve the competences in modeling practical engineering problems in different fields of building engineering.
3. Improve the computer skills of the students.

Contents of module with emphasis on teaching content

Part 1) Numerical methods in building thermodynamics and heat transfer:

- Numerical methods for modelling indoor and weather conditions (thermal comfort, indoor air quality, climatic conditions).
- Heat conduction in building elements - steady state conditions.
- Heat conduction in building elements - dynamic conditions:
 - Numerical solutions (Finite Differences);
 - Graphical solutions (Binder-Schmidt-Method);
 - Electrical analogy.
- Models for the thermal balance of a room:
 - Steady state model;
 - Quasi steady state model;
 - Detailed model of the thermal balance of a room;
 - Models based on the thermal response of the room;
 - Boundary conditions on external surfaces.
- Introduction to MATLAB software, application on test cases in fields of building engineering.
- Introduction to IDA-ICE software, application on test cases in fields of building engineering.

Part 2) Numerical methods for modelling complex heat transfer through building construction and for modelling air movement outside and inside the building (Ansys CFX / Ansys Fluent / OpenFOAM).

Part 3) Numerical methods for fire simulations (FDS).

Teaching and learning methods

- 3 lecture periods per week, with integrated exercise sessions.
- Teaching: Frontal teaching and storytelling. Discussion of practical cases. Guided learning using lecture notes and textbooks.
- Exercises: Solving practical problems under the guidance of the tutors (problem solving, modeling and programming in MATLAB, IDA-ICE, Ansys, OpenFOAM, FDS).

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Optics: Basics of wave and geometrical optics;

Without optics basics during bachelor studies, the EVA "Fundamentals of light" should be visited before visiting further TSM modules.

Physics: Basics for engineers (bachelor niveau)

Brief course description of module objectives and content

The TSM module "Optical engineering and metrology" will provide the students with knowledge of numerous engineering and practical aspects of optical components, instruments, and metrology systems. Starting from seemingly simple optical components (mirrors, lenses, gratings, filters), the module covers high tech novelties on how to improve those components and bring them to the new level. Building up on those concepts, we will

discuss more complex components, including acousto-optic, electro-optic, and liquid crystal modulators, as well as simpler systems like objectives and spectrometers. The module will be completed with methods applied in industry for measuring and diagnostics of various processes, including industrial interferometry, spectroscopy, imaging, and precise distance measurements.

Aims, content, methods

Learning objectives and acquired competencies

After successfully completing this module, the students should:

- understand the principles and know engineering aspects of basic optical components,
- be able to choose the appropriate optical element (including appropriate coating) for their tasks,
- know the principles of optical instruments and understand how some simple optical instruments operate,
- understand some optical metrology and microscopy methods, typically used in industry,
- be able to choose the appropriate optical diagnostics method for their process.

Contents of module with emphasis on teaching content

1) Optical components (total 5 weeks):

- types of mirrors and lenses, incl. different coatings (1 week);
- principles of operation and types of polarization optics (waveplates, polarizer, isolator) (1 week);
- types, characteristics and applications of optical filters: absorption, interference, neutral density, reflective, long-pass, band-pass, notch, spatial, (1 week);
- gratings (1 week);
- light modulators (chopper, LCD, AOM, EOM) (1 week);

2) Optical instruments (total 3 weeks):

- Imaging optics (MTF, aberrations, camera objectives...) (1 week);
- Spectrometers (1 week);
- Colorimetry, color spaces and laser projection and displays (1 week);

3) Optical metrology (total 6 weeks):

- Industrial inspection: interferometry, industrial vision, Moire technique, laser triangulation (1.5 week);
- Spectroscopy: linear absorption, FTIR, luminescence, Raman (1 week);
- Hyperspectral imaging (1 week);
- Microscopy: confocal, two-photon, super-resolution STED, OCT (1.5 week);
- Laser detection: LIDAR, 3D sensing and self-driven cars (1 week);

Teaching and learning methods

Lectures, open discussion with students, self-study, and practical home work.

Literature

- 1) Lecturers' scripts with references to current literature,
- 2) Saleh, Tech: Fundamentals of optics
- 3) Hecht: Optics

Brief course description of module objectives and content

In all developed economies, the service sector is the dominant economic sector. Its importance is still growing. In particular new services based on new technologies such as mobile and internet-based technologies are changing our world at a breathtaking pace. The goal of this module is to make students familiar with some of the main concepts of modern services.

The module focuses on service science and strategic service management on the one hand, and service operations management (service delivery) on the other hand.

Aims, content, methods

Learning objectives and acquired competencies

The students...

- Know the economic importance of services. They know how service delivery differs from manufacturing.
- Know the co-creation of value and the fundamentals of Service Dominant Logic as paradigms for understanding services.
- Are able to describe a service both from the perspective of a customer (perceived value) as well as from the perspective of a provider (value generation)
- Are familiar with the most important operational challenges of a service provider. They are able to apply important service-specific models of Operations Management.
- Understand the principles of service science and are able to generate and assess new service models

Contents of module with emphasis on teaching content

Service basics (3 weeks):

- Economic importance of services in developed economies
- What is a service? Service systems, coproduction and value co-creation, Service-Dominant Logic.
- Services are an experience: The service encounter
- service quality, the gap model, SERVQUAL

Service Operations Management (7 weeks):

- Managing Capacity and Demand , Capacity planning and queuing
- Managing waiting lines
- Value creation process according to Service Dominant Logic, Value for customers / conjoint analysis.
- Value for providers: Customer lifetime value and Customer Equity
- Yield management as an example of service system optimization

Service Engineering (4 weeks):

- Service optimization: Best Service is no service
- New trends in services, service workshop
- Excursion

Teaching and learning methods

- Theory with exercises
- group assignments
- case work

Bases en physiques, en électronique

Brève description du contenu et des objectifs

Ce cours se focalise sur la compréhension approfondie des composants principaux des systèmes de production d'électricité par conversion photovoltaïque. L'objectif va bien au delà de la compétence nécessaire à la conception d'un système photovoltaïque, comme le font généralement les installateurs professionnels, il vise également la compréhension détaillée du fonctionnement des composants, autant pour les différentes technologies de modules photovoltaïques que pour les différents inverseurs de topologies électroniques de puissance. Considérant le fait qu'en Suisse, un certain nombre d'employés du secteur photovoltaïque n'installent jamais de systèmes photovoltaïques, mais travaillent pour des compagnies qui fournissent les composants des modules photovoltaïques clé en main, vendus sur le marché mondial, les concepts principaux des processus et les différents concepts des chaînes de fabrication des modules photovoltaïques seront également discutés pendant les cours. Ce cours

sur la technologie photovoltaïque sera complété par des analyses des paramètres économiques relatifs aux systèmes photovoltaïques de haute technologie comprenant des facteurs clés environnementaux, comme les délais d'amortissements énergétiques. Aujourd'hui nous disposons en Suisse d'un nombre grandissant de systèmes photovoltaïques y compris un système de batterie pour l'utilisation de l'énergie photovoltaïque pendant la nuit. Le cours traite les concepts électroniques de puissance et les flux d'énergie dans ces les systèmes de stockage d'énergie photovoltaïques raccordés au réseau.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants connaîtront, non seulement, les différents types de composants du Photovoltaïque sur le marché, mais pourront aussi travailler pour des compagnies réalisant des améliorations technologiques de ces produits. Dans les exercices du cours, cette connaissance technologique sera donc entraînée en se focalisant sur les besoins de la recherche appliquée dans l'industrie de l'électronique de puissance et également comme module photovoltaïque de technologies de production et de conception d'usine d'énergie photovoltaïque.

Contenu des modules avec pondération du contenu des cours

Chapitre 1: Les bases de l'optoélectronique des différentes technologies de cellules solaires 4x3 périodes de cours

- Introduction : Différents concepts de production d'électricité renouvelable
- La physique de l'irradiation solaire, énergie et spectres
- Le coefficient d'absorption optique de plusieurs matériaux des cellules solaires – matériaux à couche mince, matériaux organiques
- Espace de bande, jonction PN, diffusion et dérivation, caractéristiques de tension électrique des diodes
- Bases de la cellule solaire STC courbe IV, schéma équivalent d'une cellule solaire et équations
- Courant photoélectrique spectral, longueur de diffusion, recombinaison de surface, homojonction et hétérojonction, cellules solaires tandem
- Efficacité de pointe des cellules et mécanisme de perte

Chapitre 2: Production industrielle des modules standard au silicium cristallin et des modules solaires à couche mince 3x3 périodes de cours

- Section transversale d'un module standard en silicium cristallin et d'un module à couche mince, flux de courant, boîtes de dérivation
- Processus standard de production pour cristallin Module Si: poly-silicone, découpage en plaques, production de cellules, enfilage, laminage, test
- Packaging, processus de laminage sur verre
- Processus de production des modules à couche mince : Production TCO, PECVD (autres), traçage au laser, laminage, back-end, test
- Exigences sur les modules photovoltaïques (standards CEI), contrôle qualité dans la chaîne de production
- Tests de qualité et méthodes de mesure de puissance nominale externe au module fabriqué avant l'installation d'une usine

Chapitre 3: Electronique de puissance photovoltaïque - Inverseurs AC/DC et batteries de stockage 4x3 périodes de cours

- Principes du convertisseur DC/DC et du tracker MPP
- Chargeur de batterie photovoltaïque, topologies, coûts
- Topologies des inverseurs photovoltaïques DC/AC : Concepts sans transformateurs et types de transformateurs, potentiel terre DC
- Circuits de contrôle, techniques anti-îlotage, composants de l'électronique de puissance, efficacité et durée de vie
- Chiffres clés de l'inverseur photovoltaïque; méthodes de calcul de l'efficacité moyenne y compris tension en courant continu et condition de chargement partiel
- Inverseurs photovoltaïques sur le marché, efficacité, coûts, règlements et code de réseau,
- Courant AC photovoltaïque et système sauvegarde sur batteries, topologies d'électronique de puissance variation de pic, puissance réactive et contrôle de fréquence
- Intégration de la production photovoltaïque fluctuante dans le réseau, prévision basée sur la météo, coûts de stockage

Chapitre 4: Conception d'une usine d'énergie photovoltaïque et aspects d'ingénierie du système 3x3 périodes de cours

- Energie solaire collectée contre orientation des capteurs, pertes dues à l'ombre, gains en suivi sur un ou deux axes
- Concept d'un système AC raccordé au réseau; composants, comparaison fenêtre de tension d'inverseur MPP
- Installation mécanique et électrique et composants du système, toit résidentiel, échelle utile des usines MW
- Code réseau électrique, protection contre la foudre
- Importance des paramètres de classification d'énergie; coefficient de température, rayonnement à faible éclairement énergétique, spectres, dégradation...
- Concept de système photovoltaïque basé sur logiciel (PVGIS, PVSYST...), aléas des prévisions annuelles de l'électricité photovoltaïque
- Ratio de performance du système, rendement, résultats des meilleures pratiques, exemples de contrôle d'un système photovoltaïque
- Coût global pour la production d'électricité photovoltaïque
- Scénarios d'amortissements énergétiques, résultats d'analyse du cycle de vie
- Tendances d'augmentation du marché photovoltaïque et emplois en Suisse, marché photovoltaïque mondial, mesures incitatives et politiques

Méthodes d'enseignement et d'apprentissage

- Cours magistral, discussion et travaux dirigés
- Exercices utilisant des notions mathématiques de base et plusieurs logiciels publics

Entry level competences**Prerequisites, previous knowledge**

Basics in Physics, Electronics

Brief course description of module objectives and content

This course focuses on the advanced understanding of the main components of Photovoltaic PV power generation systems including storage options. The goal goes beyond the competence to design a PV System, like the installer business is used to do, but also to understand how the components are working in detail, either for different PV module technologies as well as for different inverters power electronic topologies ore battery types. Due to the fact, that in Switzerland some employees in the PV sector are not installing any PV system, but working for companies supplying components of turn-key PV module production lines for the world market as well others produce batteries, the main concepts of processes and different concepts of production lines of such components are included in the course. Analysis of the economic parameter of state of art PV systems and batteries, together with environmental key factors like energy pay back times will complete this course. Today the numbers of PV systems including a battery system to

use PV electricity at night is growing in Switzerland with an increasing trend. The power electronic concepts, energy flows and control strategies in these grid connected PV and storage systems are discussed as well as levelized cost of electricity.

Aims, content, methods

Learning objectives and acquired competencies

The students will be able not only to know the different type of Photovoltaic components, like cell types, module types and inverters as well as battery types on the market, but they should be able to work for companies to develop improved products and system designs on the technology level. Several exercises are performed on applied aspects of solar cells, power electronic components, PV plant system design including batteries as well as levelized cost of electricity.

Contents of module with emphasis on teaching content

Chapter 1: Optoelectronic basics of different solar cell technologies 3x3 lectures

- Introduction: Overview of renewable electricity generation and storage
- Physics of solar irradiation, power and spectra, optical absorption coefficient of several solar cell materials
- Band gap, PN junction, diffusion and drift, diode current voltage characteristics
- Basics of solar cell STC IV curve, equivalent circuit of a solar cell and equations
- Spectral Photocurrent, diffusion length, surface recombination, homo-heterojunctions, tandem solar cell
- State of the art silicon cell, high efficiency silicon cells and loss mechanism as well as other competing technologies

Chapter 2: Industrial production of standard crystalline silicon, performance and testing 3x3 lectures

- Cross section of standard crystalline silicon and thin film module, current flow, junction boxes
- Production process standard cryst. Si module: poly Silicon, wafering, cell production, stringing, lamination, testing
- Production technology of thin film solar module technologies
- Requirements on PV modules (IEC standards), quality control in the production line and failure mechanisms of PV modules
- Quality testing
- Outdoor performance, temperature coefficients, collected solar energy versus collector orientation, one and two axis tracking gains, relevant losses like shading, soiling and degradation
- PV system test methods in the field

Chapter 3: Storage 3x3 lectures

- Overview storage technologies – power, capacity, storing period
- Lithium standard batterie cell and their components, resources
- Performance, charging, discharging, decrease of capacity, life time, recycling
- Production processes of lithium batteries
- Power electronics and control of batteries

Chapter 4: PV power electronics – AC/DC inverters and battery storage 2x3 lectures

- Principles of DC/DC converter and MPP tracking
- PV battery charger, topologies, costs
- DC/AC PV inverter topologies: transformer less concepts and transformer types, DC earth potential
- Control circuits, anti-islanding techniques, power electronic components, efficiency and life time
- Key figures of the PV Inverter; average efficiency calculation methods incl. DC-voltage and partly load condition
- PV inverters on the market, efficiency, costs, regulations and grid code, power optimizer versus string inverter
- PV AC and battery backup system, peak shift power electronic topologies and frequency control
- Integration of fluctuating PV generation into the grid, active and reactive power voltage control, storage and PV forecast

Chapter 5: PV power plant and storage design and system engineering 3x3 lectures

- Grid connected AC System design; components, inverter MPP voltage window matching
- Electrical and mechanical installation and system components, residential roof top, utility scale MW plants, grid code
- Software based PV System design, uncertainties of annual PV electricity predictions including storage
- System performance ratio, yield, best practice results, examples of PV system monitoring, annual battery cycles
- Overall cost of photovoltaic electricity generation including storage
- Energy pay-back scenarios, LCA life cycle analysis results including PV plant and battery storage
- Trends of PV and battery market and jobs in Switzerland, global markets, incentives, net present value calculations and politics.

Teaching and learning methods

- Lecture, discussion and tutorials, exercises, case studies
- Exercises using basic mathematics and several public software tools

Fundamentals of Inorganic and Organic chemistry.
Fundamental of polymeric materials

Brief course description of module objectives and content

Degradation of polymers is an important driver of plastic and rubber products failures during their service life. Therefore, understanding the mechanisms of polymer degradation is of paramount importance for properly engineering plastic and rubber products, ensuring performances all through their service life. This module discusses the impact of chemical and physical depredeating factors on the macromolecules characteristics and performances. It provides fundamentals of macromolecule degradation mechanisms, correlating this know-how with the failure of plastic and rubber products through case study analysis.

Aims, content, methods

Learning objectives and acquired competencies

Understand the chemical-physical processes of degradation of polymeric materials.
Master the possible approaches to protect polymeric materials from uncontrolled degradation.

Contents of module with emphasis on teaching content

The course content are:

- Impact of degradation factors (e.g. oxygen, UV, etc.) on macromolecules
- Impact of macromolecule degradation on mechanical/optical/chemical properties of plastic/rubber products
- Protection of plastic/rubber product against degradation

Teaching and learning methods

Teaching: Ex cathedra teaching (theory) and Presentation of case studies

Learning methods: Self study

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences
Prerequisites, previous knowledge

To attend the module, a good fundamental knowledge in electrical engineering is essential. In addition, a sound basis in power electronics and control technique is needed.

- **Power electronics:** Characteristics, driving and application of power diodes, thyristors, MOS- field effect transistors, IGBT, as well as GTO-thyristors, are known.
- **The basic power electronics circuits**, with and without galvanic isolation, are known and understood. E.g. boost and buck converter, flyback and forward converter, one- and three-phase self-commutated bridges with semiconductors having turn-off capability, line-commutated rectifiers.
- **System description** with transfer function can be derived and represented in a Bode diagram. Additionally, a basic knowledge of descriptions in state space is useful.
 PI- controller design with help of the Bode diagram (or other methods) can be carried out.

Brief course description of module objectives and content

Building upon the students' fundamental knowledge in power electronics, this module covers current topics in the field of power electronics in greater depth. In the first part, the focus is on modern switched mode power conversion topologies, small signal modelling, control methods and the magnetic components. The second part looks into topologies, modulation schemes and control techniques for medium and high-power converters. One application discussed in greater depth is their application in power grids.

Aims, content, methods

Learning objectives and acquired competencies

The students are taught modelling methods, structure and control of power electronics circuits based on selected practical and realistic examples.

Contents of module with emphasis on teaching content

Switched mode power supplies: 7x3h

- Overview over the most common topologies
- Soft switching in switched mode power converters
- Resonant converter
- Small signal modelling of switched mode power converters
- Control of switched mode power converters
- Magnetic components
- Integrated magnetics

Medium and high-power converters: 7x3h

- Three-phase inverters (topologies, modulation techniques, harmonics)
- Multi-level inverters (topologies, modulation techniques, harmonics)
- Rectifiers and transformers for higher pulse-numbers
- Control methods for converters
- Special features of high-power converters like semiconductors, protection and cooling
- FACTS (Flexible AC Transmission Systems): applications of high-power converters in energy transmission like interties, SVC (Static-Var-Compensation), DVR (Dynamic Voltage Restorer), HVDC (High Voltage DC Transmission)

Teaching and learning methods

- Lecture, interactive instruction and discussion
- Embedded exercises (with Matlab, Simulink and PLECS)

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Basics of electrical laws, circuitries, components in power grids, energy conversion, electric charge, electric field, as well as of ordinary and partial differential equations expected.

Brief course description of module objectives and content

In this module, students will increase their knowledge in selected areas of power grids in electricity distribution and transmission:

- high voltage engineering and relevant design problems
- learn the origin of networks failures, consequences, preventing and recovery measures
- design, construction and parameters of components in power grids
- organization of voltage and power regulation in interconnected grid
- math. analyze and control in power grids

- special actual problems in TD (transmission and distribution)

Aims, content, methods

Learning objectives and acquired competencies

Students

- know the main challenges of today's modern grids
- know the main elements of an electrical grid and the differences of transmission components
- possess a fundamental knowledge of the principles of designing high voltage equipment.
- Know the basic design and technical solutions of the most important high voltage equipment in a power grid
- have become acquainted with the static/dynamic modelling and simulation of high voltage components.
- know how to design power grids
- know how to perform basic grid calculations
- know the behavior of meshed grids in normal operation
- know the DC transmission technology
- can describe the advantages of smart-grid applications for the DSOs
- learn the basic principles of the management and regulation of electrical grids

Contents of module with emphasis on teaching content

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Linear Algebra
- Differential equations
- Basic feedback control and dynamic systems
- Basic programming skills in Matlab or Python or equivalent
- General affinity to mathematics(!)

Brief course description of module objectives and content

Model Predictive Control (MPC) is an optimisation-based approach to control systems and processes. The general mathematical formulation of MPC allows it to be applied to a broad range of systems and considers system constraints intrinsically. The advances in optimisation methods and available computational power have made MPC a valuable alternative to classical control approaches also for fast dynamic systems. Today, MPC applications can be found from the original chemical process control systems to the control of frequency converters with sampling periods down to a few microseconds.

This module focuses on introducing MPC from the theoretical basics to the use of tool kits to support the implementation and generation of working code. As the classical frequency domain control methods are not considered here, this module does not need in-depth knowledge of control systems. A general affinity to mathematics and programming skills are beneficial.

Aims, content, methods

Learning objectives and acquired competencies

The student is able to

- formulate an optimisation problem and solve it with appropriate tool kits
- formulate model predictive control problems
- apply MPC concepts to real world systems and generate executable code which runs on their control systems

Contents of module with emphasis on teaching content

Basic concepts (3W)

- Introduction to state space models in continuous and discrete time
- Introduction to optimisation (linear quadratic programs) using tool kits like YALMIP
- Introduction to optimisation with constraints

Basic MPC (3W)

- MPC problem formulation
- Receding horizon concepts
- Limits of MPC

Real-time implementation(3W)

- From problem to code using tool kits like ACADO

MPC Extensions and examples (5W)

- Reference tracking
- Buck converter control (explicit MPC)
- Nonlinear optimisation and MPC with nonlinear models
- Energy management (scheduling)

Teaching and learning methods

Lectures with homework assignments which are a mix of theoretical exercises and programming assignments.

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Students should have a keen interest in process engineering and energy engineering issues. Attendance of the module requires prior knowledge of engineering thermodynamics. This includes, in particular:

- the first law (and ideally also the second law) of thermodynamics and its application to flow processes and energy conversion systems such as heat engines, heat pumps or cooling systems
- a good understanding of the concept of enthalpy for pure substances
- the theory of heat transfer: fundamental laws of heat transfer; mean logarithmic temperature difference of co-current and counter-current heat exchangers
- **the calculation of mass, component and energy balances for common industrial unit operations and processes**

Prior knowledge of thermal process engineering and the energy integration of processes is desirable but not absolutely essential for attending the module.

Brief course description of module objectives and content

Against the background of rising energy prices, incentive taxes and ecological requirements, increasing importance is being attached to reducing the energy requirements of industry. The key to higher energy efficiency and cost-efficiency in thermal processes is the energy integration of processes with the aid of pinch analysis. This is characterized by a systematic approach which can be applied to establish the best system design and the optimum energy input from the economic viewpoint. From the results of the analysis, it is possible to derive measures for heat recovery and an improved energy supply in the context of strategic planning.

In this module, students learn the fundamental methods of the energy integration of processes with the aid of pinch analysis. After completing the module, they are in a position to conduct pinch analyses by themselves for "straightforward" industrial processes and to answer the following questions: how large is the energy requirement if an existing plant were to be fully-optimized? Where is the economic optimum for the investment and energy costs? How can this optimum state be achieved? They can then support industrial companies in sustainable development and in the reduction of CO₂ emissions, since reducing energy requirements goes hand in hand with increasing cost-efficiency.

Aims, content, methods

Learning objectives and acquired competencies

The student

- understands the "nature/philosophy" of process design as well as the energy integration of processes and pinch analysis (onion model, targets before design).
- can complete the mass, component and energy balance for industrial processes with several components and phases and masters the fundamental laws of the thermodynamics for multi-component systems (only ideal two-component systems, e.g. humid air).
- masters the thermodynamically correct assessment of energy conversion systems and the fundamentals of heat transfer with regard to the energy integration of processes and pinch analysis.
- is in a position to determine the energy targets, heat transfer area targets and cost targets of processes (continuous and non-continuous) using the fundamental methods of pinch analysis (problem table algorithm, composite curves, grand composite curve and cost curves, etc.).
- is familiar with and understands the "golden rules" of pinch analysis plus the rules for the design of heat exchanger networks, and is able to apply these for practical cases. He/she can, additionally, optimize heat exchanger networks.
- is able to correctly place utilities such as steam and cooling water systems and also energy conversion systems like heat pumps, combined heat and power generation systems, etc. in a process.
- after completing the module, is in a position to correctly perform the energy modeling of a process and conduct the pinch analysis independently with the aid of software, and to work out measures for increasing efficiency.

Contents of module with emphasis on teaching content

The module contents are divided up as follows (14 semester weeks)::

1. *Introduction*: Energy and Resource Requirements of Industrial Processes, Nature of Process Design and Integration, Mass, Component and Energy Balances
2. *Refresher Energy Conversion Units (ECUs)*: 1st and 2nd Law of Thermodynamics Analysis in Relation to Pinch Analysis, Heat Engines, Heat Pumps (HP), Mechanical and Thermal Vapour Recompression (MVR/TVR), Combined Heat and Power (CHP) Generation Systems, Utility Systems
3. *Heat Transfer and Heat Transfer Equipment*: Overall Heat Transfer Coefficients, Temperature Differences in Heat Exchangers (HEXs), Different Types of HEXs
4. *Energy and Cost Targets*: Composite Curves (CC), Heat Recovery Pinch, "Golden Rules" of Pinch Analysis, Energy Targets
5. *Energy and Cost Targets*: Process Economics, HEX Area Targets, Number of HEX Units, Cost Targets, Trade-off Between Annualized Capital and Operating Costs (Supertargeting), Introduction to Process Analysis and Design Tool PinCH
6. *Heat Exchanger Network (HEN) Design*: Design of Minimum Energy Requirement or Maximum Energy Recovery (MER) HEN, The Pinch Design Method, HEN Design Grid, Stream Splitting, HEX Details
7. *Stream Data*: Basic Principles of Data Extraction for Pinch Analysis
8. *Optimization of Energy Supply Systems*: Shifted Composite Curves, Grand Composite Curve (GCC), Utility Selection and Placement (Steam Systems, Furnaces, Cooling Water Systems), Problem Table Algorithm
9. *Integration of ECUs*: Integration of HP and Refrigeration Systems, MVR, TVR
10. *Integration of ECUs*: Appropriate Placement of Heat Engines, Integration of CHP Systems: Steam Turbines, Gas Turbines, Reciprocating Engines
11. *Optimization of HEN Design*: Design for Threshold Problems, Design for Multiple Pinches, Network Optimization (relaxed HEN, Loops, Paths)
12. *Multiple Operating Case (MOC) Analysis*: Challenges and Approach for MOC-Problems, Conventional Design Type, Resequencing Design Type, Split Grand Composite Curve (Split GCC) and Indirect Heat Recovery (IHR)
13. *Batch Process Analysis*: Time Averaged Models (TAM) and Time Slice Models (TSM), Supertargeting Optimization, Scheduling, Indirect Source and Sink Profile (ISSP)
14. *Batch Process Analysis*: Approach for Batch Process Analysis, Types of Thermal Energy Storage (TES) and Integration

Teaching and learning methods

- Classroom Instruction (2 lecture periods per week)
- Exercises/tutorials (1 period per week)
- Individual study from the course script and papers
- Homework (weekly) with subsequent discussion
- Solving case studies with the PinCH software (see www.pinch-analyse.ch)

Literature

A script and additional documents will be made available to students. The following books are recommended for reading:

- Robin Smith: Chemical Process Design and Integration, Wiley, 2007, ISBN 978-0-471-48681-7
- Ian C. Kemp: Pinch Analysis and Process Integration: a User Guide on Process Integration for the efficient Use of Energy, Elsevier Butterworth-Heinemann, 2007, ISBN 978-0-7506-8260-2

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

To attend this module, students must have a Bachelor's degree in Mechanical Engineering from a Swiss University of Applied Sciences. Depending on the specific nature of the course, a Bachelor's degree in Electrical Engineering from a Swiss University of Applied Sciences may also be acceptable, providing that the student has successfully completed modules covering methodological product development in the field of consumer and/or investment goods.

Development methods and Product innovation

The students:

- know the purpose and content of project specifications and requirements with respect to user needs,
- know several methods of finding solutions (such as, for example, functional structures active principles, morphological box)
- know the evaluation methods (value benefit analysis, SWOT analysis, etc.)
- have worked in a team on at least one small development project

Product Lifecycle Management

The students:

- know the product conception process (in the consumption and/or investment goods sectors)

- know the meaning and purpose of product structures
- have experience in the application of a 3D CAX system (Master Model Approach) or have worked with complex-structured data in other applications

Brief course description of module objectives and content

Students become acquainted with the product innovation process and its strategic importance for enterprises. They recognize the relationship between the **product innovation** process and the **product development** process. Students will get to know and train typical methods of both processes and will gain deeper knowledge of the subject by doing “hands-on”-project work.

In **Product Lifecycle Management (PLM)**, product innovation and development deal with in the context of the entire product lifecycle. The course will focus on the information flow across an industrial enterprise from data considering its organization (local, global), the processes (engineering, sales, manufacturing, purchasing, service), the product characteristics and the different IT tools (CAX, PLM, ERP). Aspects such as product structures, product variants, and release and change processes are important components of PLM. In team and project work, students will solve real life problems in a “laboratory environment”.

Aims, content, methods

Learning objectives and acquired competencies

Students

- know the importance of innovation for enterprises,
- understand the integration of technological product innovation and product development in business processes within enterprises,
- possess an in-depth knowledge of the product innovation process (processes, methods, and tools),
- can correctly apply methods and tools in the innovation process according to the situation,
- know the importance of PLM in enterprises,
- possess an in-depth knowledge of the product conception process,
- possess an in-depth knowledge concerning product structure and product variants (serial and plant production) and can apply these in concrete examples,
- know the relationship between the most important data generation systems and management systems of technological product data,
- know the impact of design decisions and design data for all subsequent processes in an enterprise,
- understand the role of product information and its relationship with industry 4.0,
- can define the most important workflows in concrete application in the product conception stage (as an essential condition for the operation of a PLM system).

Contents of module with emphasis on teaching content

The module comprises the two main subject areas: “Development methods and product innovation” and “Product lifecycle management”. The two areas have been divided up into a total of 14 courses, which are listed below. The individual courses all have roughly the same weighting. A “convergence phase” of approximately two lessons is provided for in each area.

Development Methods and Product Innovation

- TRIZ/ TIPS (Theory of inventive problem solving): The importance of task formulation, the ideal machine, matrix of contradiction matrix, procedural principles, substance-field analysis, the evolution of technical systems
- Innovation strength
- Classical methods VDI 2221, 2222, 2206
- Product innovation process
- Strategic product planning: potential planning, product planning, business planning, strategic control
- Integrative product development
- Virtual product development tools for components, machines, and manufacturing plants: 3D CAX systems, digital mock-up, model building, model analysis, production (process) planning, product data technology

Product Lifecycle Management

- Basic principles: Product model, Product Data Management (PDM), Product Lifecycle Management (PLM)
- Product conception process: Business processes, data-process relationship, from the idea to waste disposal
- Product structures: Variant management, product configuration, material master data, product description data
- Lifecycle: Lifecycles of individual data objects, status of objects
- Release processes and change management
- Data models and authorizations
- Advanced topics of product lifecycle management (industry 4.0)

Teaching and learning methods

- Ex-cathedra teaching
- Project-oriented work in the form of group work during the students' self-study hours (students will be assisted through Moodle, presentations, etc.)

Documentation		X F 100%		X E 100%
Examen		X F 100%		X E 100%

Catégorie de module

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Pour assister à ce module, les étudiants doivent être titulaires d'un diplôme de bachelor en génie mécanique obtenu dans une haute école suisse de sciences appliquées. En fonction de la nature spécifique du cours, un diplôme de bachelor en génie électrique obtenu dans une haute école suisse de sciences appliquées pourrait également être accepté pourvu que l'étudiant ait mené à bien des modules consacrés au développement méthodologique de produits des secteurs des biens de consommation et/ou d'équipement.

Méthodes de développement et innovation produit

Les étudiants :

- connaissent la finalité et le contenu de spécifications de projet
- connaissent plusieurs méthodes de recherche de solutions (telles que les structures fonctionnelles, les principes actifs la boîte méthodologique)
- connaissent les méthodes d'évaluation (analyse de la valeur, analyse SWOT, etc.)
- ont travaillé au sein d'une équipe sur au moins un petit projet de développement

Product Lifecycle Management

Les étudiants :

- connaissent le processus de conception d'un produit (dans les secteurs des biens de consommation et/ou d'équipement)
- connaissent la signification et la finalité des structures de produits
- ont de l'expérience de l'application d'un système de CAD en 3D (approche du modèle maître) ou ont travaillé avec des données complexes structurées dans d'autres applications

Brève description du contenu et des objectifs

Les étudiants se familiarisent avec le processus d'innovation produit et son importance stratégique pour les entreprises. Ils reconnaissent la relation entre le processus d'**innovation produit** et le processus de **développement produit**. Des méthodes typiques des deux processus seront étudiées et des outils et des projets pratiques permettront d'approfondir la matière.

Dans le cadre de la gestion du cycle de vie d'un produit - **Product Lifecycle Management (PLM)**, l'innovation produit et le développement produit seront analysés compte tenu de l'ensemble du cycle de vie d'un produit. Le cours se concentrera sur les flux d'informations qui circulent au sein d'une entreprise industrielle en tenant compte de son organisation (locale, globale), des processus (ingénierie, ventes, fabrication, achats, service après-vente), des caractéristiques du produit et des différents outils informatiques (CAD, CAM, PLM, ERP). Des éléments tels que les structures et les variantes de produit, les processus de validation et de modification sont considérés comme des composants importants de la PLM. Des problèmes issus de cas réels seront résolus dans un « environnement de laboratoire » en travail en équipe ou sur un projet.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants

- connaissent l'importance de l'innovation pour les entreprises ;
- comprennent l'intégration de l'innovation produit technologique et du développement d'un produit dans les processus internes aux entreprises ;
- possèdent des connaissances approfondies du processus d'innovation produit (procédés, méthodes et outils) ;
- savent appliquer correctement les méthodes et les outils pertinents dans le cadre du processus d'innovation en fonction de la situation ;
- connaissent l'importance de la PLM dans les entreprises ;
- possèdent des connaissances approfondies du processus de conception de produits ;
- possèdent des connaissances approfondies des structures de produits et des variantes de produits (production en série et en usine) et savent les appliquer dans des exemples concrets ;
- connaissent la relation entre les systèmes de génération de données les plus importants et les systèmes de gestion des données technologiques de produits ;
- connaissent l'impact des décisions de conception et des données de conception sur tous les processus aval dans l'entreprise ;
- comprennent le rôle de l'information produit à différents niveaux pour les nouveaux concepts tels que la gestion du cycle de vie en boucle fermée, la numérisation et industrie 4.0 ;
- savent définir les flux d'informations les plus importants dans des applications concrètes au stade de la conception d'un produit (condition essentielle de l'utilisation d'un système de PLM).

Contenu des modules avec pondération du contenu des cours

Le module se compose de deux thématiques principales : les méthodes de développement et l'innovation produit ; la gestion du cycle de vie d'un produit (PLM). Les deux thématiques ont été divisées en 14 cours énumérés ci-dessous. Les cours individuels bénéficient tous globalement de la même pondération. Une phase de convergence d'environ deux périodes est proposée pour chaque thématique.

Méthodes de développement et innovation produit

- TRIZ/TIPS (Theory of inventive problem solving) – théorie de résolution inventive des problèmes : l'importance de la formulation de tâches, la machine idéale, la matrice des contradictions, les principes de procédure, l'analyse du champ de substance, l'évolution des systèmes techniques
- Méthodes classiques : VDI 2221, VDI 2222, VDI2206
- Force d'innovation
- Processus d'innovation produit
- Planification stratégique de produit : planification potentielle, planification du produit, planification des affaires, contrôle stratégique
- Développement intégré de produit
- Outils de développement virtuel de produit pour les composants, les machines et les usines de fabrication : systèmes de CAO en 3D, maquettes numériques, construction de modèles, analyse de modèles, planification de la production/du processus de production, technologie des données de produit

Product Lifecycle Management

- Principes de base : modèle de produit, Product Data Management (PDM) – gestion de produit, Product Lifecycle Management (PLM) – gestion du cycle de vie d'un produit
- Processus de conception de produit : processus d'affaires, relation données / processus, de l'idée à l'élimination des déchets
- Structures de produit : gestion des variantes, configuration du produit, données centrales de matériaux, données de description de produit
- Cycle de vie : cycles de vie d'objet de données individuels, statut d'objets
- Processus de validation et gestion des modifications
- Modèles de données et autorisation
- Thèmes avancés concernant la gestion du cycle de vie d'un produit - Product Lifecycle Management

Méthodes d'enseignement et d'apprentissage

- Enseignement ex cathedra
- Travail tourné vers les projets dans le cadre d'un travail de groupe pendant les heures de révision autonome des étudiants (les étudiants seront aidés par l'intermédiaire de Moodle, de présentations, etc.)

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Procedural and object oriented programming
- Software engineering (UML or other)
- Basic notions of algorithms and complexity
- Basic notions of concurrent programming (Threads)

Brief course description of module objectives and content

The objective of this module is to present an overview of parallel and distributed computing and related algorithms. The first part of the course will be dedicated to the architectures of parallel and distributed infrastructures, the different theoretical models for these architectures and the different programming models and tools for programming such architectures. The second part will be dedicated to the study of a number of classical parallel and distributed algorithms. This course includes practical work to train the student in the use of parallel and distributed computing.

Aims, content, methods

Learning objectives and acquired competencies

At the end of the course the student knows:

- The most common parallel and distributed hardware infrastructures
- The different ways to model and efficiently program these architectures
- How to choose the proper parallel or distributed algorithm to write an application for solving a specific problem on a specific architecture
- How to efficiently program this application
- How to assess the performance of this application

Contents of module with emphasis on teaching content

Introduction

- Different architectures of parallel and distributed infrastructures
- Communications models and communication costs
- Performance metrics for parallel and distributed systems
- Scalability of parallel and distributed systems

Heterogeneous shared memory systems

- Architecture of widely used multi-core systems
- Parallel programming models (OpenMP)

Distributed memory systems

- Communication operations and their costs
- Message passing paradigm (MPI)
- Distributed object paradigm

Parallel and distributed algorithms

- Asymptotic analysis of parallel programs
- Decomposition techniques
- Mapping techniques for load balancing
- Matrix-vector and matrix-matrix multiplication
- Parallel and distributed sorting algorithms
- Parallel and distributed Graph algorithms

Teaching and learning methods

This course involves theoretical presentations and practical exercises or laboratories. Some of the exercises or laboratories are programming exercises that can be done at home by accessing a parallel and distributed infrastructure made available through the internet.

Literature

- A. Introduction to Parallel Computing, Zbigniew J. Czech, Cambridge University Press, 2017
- B. An Introduction to Parallel Programming, 1st edition, Peter Pacheco, Morgan Kaufmann Publishers Inc, 2011

Catégorie de module

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Programmation procédurale et orientée-objet
- Ingénierie logicielle (UML ou autre)
- Notions de base en algorithmique et complexité
- Notions de base en programmation concurrente (processus)

Brève description du contenu et des objectifs

L'objectif de ce module est de présenter un aperçu de l'informatique parallèle et distribuée ainsi que des algorithmes y afférant. La première partie du cours est consacrée aux architectures parallèles et distribuées, les différents modèles théoriques de ces structures et les différents modèles et outils pour programmer ces architectures. La deuxième partie sera dévolue à l'étude de certains algorithmes parallèles et distribués classiques. Ce cours comprend une partie pratique pour familiariser les étudiants à l'usage de l'informatique parallèle et distribuée.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Au terme du cours, l'étudiant:

- connaît les infrastructures matérielles parallèles et distribuées les plus courantes;
- connaît les différentes méthodes de modélisation de ces architectures;
- sait choisir entre algorithme parallèle ou distribué selon le cas pour écrire une application qui résout un problème spécifique sur une architecture donnée;
- est capable de programmer efficacement cette application;
- sait comment évaluer la performance de cette application.

Contenu des modules avec pondération du contenu des cours

Introduction

- architectures parallèles et distribuées
- modèles et coûts de communication
- métriques et indicateurs de performance
- scalabilité de systèmes parallèles et distribués

Systèmes parallèles hétérogènes

- architecture des infrastructures multicore
- modèles et outils de programmation (OpenMP)

Systèmes distribués

- opérations de communication et coûts
- transmission de message (MPI)
- programmation objet distribués

Algorithmes parallèles

- analyse asymptotique des coûts des algorithmes parallèles et distribués
- techniques de décomposition
- techniques de dispatching et répartition de charge
- produit matrice-vecteur et matrice-matrice
- algorithmes de tri parallèle et distribué
- algorithmes pour les graphes

Méthodes d'enseignement et d'apprentissage

Ce cours contient des présentations théoriques ainsi que des exercices pratiques ou laboratoires. Une partie des exercices sont des exercices de programmation qui peuvent être réalisés à la maison en accédant à une infrastructure parallèle et distribuée rendue accessible via internet.

Bibliographie

Linear Algebra:

- Solving systems of linear equations with Gaussian elimination
- Vector and matrix calculus

Analysis:

- Differential calculus of one variable

Statistics:

- Fundamentals of probability theory
- discrete and continuous density functions

Brief course description of module objectives and content

Operations management is concerned with the design, operation and optimization of the value-adding areas of a company. At the strategic level it includes in particular the design of infrastructure and resources, the dimensioning of capacity and the definition of business processes. At an operational level, it includes ongoing planning and control of operational activities. The aim is to achieve high business performance through clever organization and efficient use of resources. In a first part an overview of the classical themes of Operations Management is given. In a second part selected methods of quantitative Operations Management (see Operations Research) are applied to tasks of important areas (see contents below) of Operations Management. These tasks will be analyzed and optimized with the help of mathematical models.

Aims, content, methods

Learning objectives and acquired competencies

- The students have an overview of the various areas of Operations Management.
- The students can classify operational issues in the tasks of the Operations Management (i.e. design or operations).
- The students know selected quantitative methods and models of Operations Management.
- The students can make use of the learned methods and are aware of the assumptions and restrictions of these.
- The students can formulate practical questions from Operations Management as mathematical models.

Contents of module with emphasis on teaching content

Part 1 (2 weeks):

- Overview of the areas of Operations Management (design and operations)
- Focus on operations
 - Overview production planning and control
 - Aggregate planning: Sales & operations planning and master production scheduling

Part 2: From the areas below selected methods of quantitative Operations Management are taught.

- Capacity planning and lead times (1 week)
- MRP concepts, mathematical foundation of MRP planning calculations (2 weeks)
- Lotsizing and inventory control (3-4 weeks)
- Scheduling (5-6 Wochen)

Teaching and learning methods

Lektionen

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Die Kursteile zur Regionalentwicklung und Regionalpolitik beziehen sich auf das politische Umfeld der Schweiz. Es ist deshalb erforderlich, die Strukturen und Abläufe des politischen Systems Schweiz zu kennen.

Kurzbeschreibung der Inhalte und Ziele

Lernziel des Moduls ist, dass die Studierenden die Argumentationen, Strukturen und Instrumente kennen, mit welchen auf Ebene unterschiedlicher Gebietskörperschaften Entwicklungsstrategien erarbeitet und umgesetzt werden. Raumplanung und weitere konzeptionelle und planerische Arbeiten sind in dieses Umfeld eingebettet. Deren Dynamiken resp. die Handlungsweise der beteiligten Akteure lassen sich aus diesem Umfeld heraus verstehen und werden damit – aus Sicht der Planung gesprochen – kalkulierbar. Nach Abschluss des Moduls sollen die Studierenden in der Lage sein, Fragestellungen ihrer spezifischen Studien- und Berufsrichtung auf zielführende Weise in den Kontext von Regionalentwicklung und Regionalpolitik einzubetten.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Übergeordnetes Lernziel: Die Studierenden sind in der Lage, auf Basis regionalwissenschaftlicher Analysen und Theorien ein Managementkonzept für eine Region zu entwickeln.

Detaillierte Lernziele: Die Studierenden sind in der Lage...

- die Bedeutung von Empirie, Theorie und Politik in der Raumentwicklung zu erläutern.
- Kriterien zur Abgrenzung von Regionen zu nennen und anhand von konkreten Beispielen zu illustrieren.
- die Bedeutungsvielfalt des Raumbegriffs zu beschreiben.
- die Komplexitätsebenen des Raumes anhand von Beispielen zu erläutern.
- wichtige Erklärungsgrundlagen (Theorien) für räumliche Entwicklung zu überblicken.
- Lesarten von Metropolregionen zu nennen und deren Bedeutung für die Raumentwicklung darzulegen.
- die Wirkungsweise des Standortwettbewerbs zu erklären.
- die Herausforderungen im Zusammenhang mit dem Fiskalföderalismus zu erläutern.
- den Stakeholder-Begriff zu erklären und eine Stakeholder-Analyse durchzuführen.
- Zentrale Herausforderungen von „Regional Governance“ zu erläutern.
- Ein Management-Konzept für eine Region zu entwickeln.

Modulinhalt mit Gewichtung der Lehrinhalte

Dem Modul liegt eine funktionalräumliche Sichtweise zugrunde. Städtische und ländliche Räume stehen sowohl unter- als auch zwischen einander in funktionalen Beziehungen. Durch diese Verflechtungen ergeben sich je nach Region unterschiedliche Potentiale, Herausforderungen und Entwicklungsmöglichkeiten. Im Kurs werden zentrale Themen und Herausforderungen vorgestellt und diskutiert, die sich aus den aktuellen funktionalräumlichen Verflechtungen ergeben. Weiter wird aufgezeigt, mit welchen Instrumenten in der Schweiz ein Interessens- und Disparitätenausgleich stattfindet. Der Kurs widmet sich auch regionalökonomischen Fragestellungen. Entwicklung schliesst weit mehr ein als ökonomische Entwicklung. Gleichwohl werden die ökonomischen Argumente in der (politischen) Diskussion um Regionalentwicklung stark gewichtet, woraus sich die Notwendigkeit ergibt, die diesen Argumentationen zu Grunde liegenden Modelle und Theorien zu kennen. Schliesslich beschäftigt sich der Kurs auch mit der Frage der politischen Steuerung auf regionaler Ebene, wobei der seit 2008 in Kraft stehenden „Neue Regionalpolitik“ (NRP) sowie dem aktuellen „Raumkonzept Schweiz“ besondere Beachtung geschenkt werden.

Lehr- und Lernmethoden

Vorwiegend Lehrgespräche und Aufarbeitung / Diskussion aktueller Beispiele im Unterricht / Entwicklung eigener regionaler Strategien

Bibliografie

Unterlagen werden im Unterricht abgegeben resp. auf moodle gestellt.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**The students are expected to have basic knowledge of aircraft engineering such as:

- Aerodynamics
- Aircraft Structures
- Understanding of Aircraft Systems
- Understanding of Aircraft Propulsion
- Basic concepts of Maintenance
- Safety:
 - System Safety
 - Safety Process

Brief course description of module objectives and content

Safety-critical systems are those systems whose failure could result in loss of life. An aircraft such as an airliner has more than one safety critical systems.

The system engineering activities required to design and manage these complex systems over their life cycles require a deep understanding of several disciplines and a systematic approach to problems such as:

- Requirements engineering
- Requirement based testing
- Validation and verification of complex function
- Coordination of teams

In this module the students will have an overview of Safety Critical Systems and related engineering activities and how these activities must be planned and executed in order to lead to successful certification and continued airworthiness.

Aims, content, methods

Learning objectives and acquired competencies

Understand core engineering and human-centered disciplines necessary to successful design, development and continued airworthiness of Safety Critical Systems (SCS).

The student are expected to acquire the following competencies:

- Understanding of safety critical system
- Understanding of system engineering principles
- Understanding of system components qualification
- Understanding of aircraft certification process
- System Thinking

Contents of module with emphasis on teaching content

Syllabus:

1. Introduction to Safety Critical Systems (SCS): General Concepts, Examples of SCS
2. Introduction to SCS: Complexity, Byzantine Problems, Multidisciplinarity
3. Requirement Engineering
4. Robustness, Redundancy, Dissimilarity and Integrity
5. Manned vs. Unmanned Systems
6. Manned Aircraft: Safety, DAL, Airworthiness
7. Unmanned Aircraft: Concept of Operations, Holistic Approach/SORA, Integration with Manned Aviation
8. System Modeling and Simulation
9. System Testing of SCS
10. Design and Development of Complex HW
11. Design and Development of SW
12. System Thinking
13. Risk Management
14. Team Management
15. Time Management

Teaching and learning methods

- All lectures are strictly connected to current aviation practice and, where feasible, practical examples will be provided
- Real world examples with lessons learned will be provided for self study

Chrisitan Kowalkowski & Wolfgang Ulaga. Service Strategy in Action: A Practical Guide for Growing Your B2B Service and Solution Business. March 2017. ISBN: 9780692819104.

<http://servicestrategyinaction.com>Editors: **Kohtamäki, M., Baines, T., Rabetino, R., Bigdeli, A.Z.** (Eds.). (2018). Practices and Tools for Servitization -Managing Service Transition. Palgrave.<https://www.palgrave.com/us/book/9783319765167>

Brief course description of module objectives and content

This module will help students to understand how a manufacturer changes its business model to provide a holistic solution to the customer, helping the customer to improve its competitiveness, rather than just engaging the sale of product. Much of the course is based around the transition from pure products to provide product service systems in basic and advanced forms.

Aims, content, methods

Learning objectives and acquired competencies

- To gain an appreciation of the role of servitization in the competitive landscape
- To create innovative value propositions by designing new service offerings and by drawing the customer journey
- To design an integrated ecosystem for services and products
- To understand the move towards a service mind-set
- To develop price strategies for services
- To manage the core processes for successful service delivery
- To manage risks and business benchmarking to identify improvement areas

Contents of module with emphasis on teaching content

- Lecture 1 Introduction to the module
- Lectures 2&3 Part 1 - Industrial services
 - Typical services that exist today
 - Aftersales
 - The service mind set
 - Example use cases
 - Input from theory and from practice to show how richness of the services.
- Lectures 4-9 Part 2 - Service design for value creation
 - Customer value proposition in services
 - Customer ecosystems and market segmentations
 - Customer journey mapping and blue printing
 - Service selling and pricing
 - Modularity in services
 - Customer business processes
 - Integration of IOT into customer value propositions
- Lectures 10-14 Part 3 - Service delivery for value capture, Shaun West
 - Ecosystems and managing co-delivery
 - Resource management
 - Risk management, legal and controlling
 - Culture change
 - Service business benchmarking
 - Managing the installed base
 - Service company processes
 - Customer experience management

Teaching and learning methods

- Lectures
- Group work, presentation and discussion of case studies
- Self-study of papers and analysis of business case studies.

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Basics in probability theory
- Basics of information theory: entropy, basic source coding, linear block codes (e.g., CRC, Hamming)
- Basics in free-space propagation
- Basic modulation techniques: AM/FM, digital modulations
- Knowledge of the Fourier transform (theory and applications)
- Matlab user knowledge

Brief course description of module objectives and content

The aim of this module is to provide insight into state-of-the-art methods of how to make a signal fit for transmission over a cable or over the air. It starts with some information-theoretic aspects, covers modern modulation formats, hardware used, and closes with an excursion into propagation mechanisms.

Aims, content, methods

Learning objectives and acquired competencies

The students:

- understand the basic descriptions of a communication chain from a signal processing point of view,
- can describe the complete transmission chain, for several state-of-the-art communication systems,
- know the main characteristics, advantages and disadvantages of the presented techniques,
- are aware of the current research directions in advanced transmission technologies.

Contents of module with emphasis on teaching content

- Complex base-band representation, CIC filters
- Detection theory
- Adaptive filters (LMS, RLS, Kalman Filter)
- Code-Division Multiple Access (CDMA), Ultrawideband (UWB)
- Orthogonal Frequency Division Multiplex (OFDM)
- Trellis-Coded Modulation (TCM)
- Architectures of optimal receivers
- Zero-IF, low-IF, bandpass architecture
- Wave propagation models for wireless communications
- Digital signal transmission over multipath channels
- Smart antenna systems

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basic knowledge about building technology and energy

Brief course description of module objectives and content

In this module, students shall become acquainted with smart systems that are already or soon to be found in buildings. Those include Building Automation and Control Systems (BACS), Smart Homes, IoT-solutions, Energy Management Systems (EMS) and building security. The students will get to know the purpose, applications and functionality of these systems. In addition, they will perform hands-on experiments with some of them. Finally, some common fundamentals will be addressed, including components, protocols and communication technologies for smart building systems.

Aims, content, methods

Learning objectives and acquired competencies

Learning objectives. The students shall:

- Become acquainted with smart systems for buildings, including BACS, Smart Home, EMS and building security systems
- Understand the purpose, applications and functionality of such systems
- Learn the required fundamentals, i.e. components, protocols and communication systems for smart building systems

Acquired competencies. The students shall be able to:

- Understand and use common smart systems for buildings
- Create concepts of smart building systems for a given building

Contents of module with emphasis on teaching content

1. **Introduction:** History of (smart) buildings, definition and structure of a smart building, applications overview
2. **Fundamentals.** Components, protocols, communication technologies (wired and wireless)
3. **Applications.** Building Automation and Control Systems, Smart Home, Internet of Things, Energy Management Systems, building security
4. **Implementation.** Construction process & smart systems
5. **Trends.** Future trends in technology, applications, processes

Teaching and learning methods

- 3 lecture periods per week, with integrated exercise sessions and hands-on experiments
- Teaching: Frontal teaching and storytelling. Discussion of practical cases. Guided learning using lecture notes and textbooks
- Exercises: Solving practical problems under the guidance of the tutors (*coaching*)

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Object-oriented programming and design in more than one programming language
- Unified Modeling Language (UML)
- Design Patterns: Elements of Reusable Object-Oriented Software (Gamma, Helm, Johnson, Vlissides; ISBN 0-201-63361-2)
- Version and configuration management concepts
- Unit testing concepts and practice
- Basic knowledge of Scrum

Brief course description of module objectives and content

The module provides an in-depth view of selected topics of modern software engineering. These stem from the fields: modern software development processes, software architecture, and the principles of evolution of software systems.

Aims, content, methods

Learning objectives and acquired competencies

- The student applies and understands benefits and liabilities of agile and lean development
- The student knows about advanced architectural and design patterns and uses them to drive and reflect on design decisions
- The student has the awareness of software as a continuously evolving and complex system
- The student knows and can select maintenance and evolution techniques for continuous development of evolving and extension of legacy software systems while maintaining its quality

Contents of module with emphasis on teaching content

Modern Software Engineering

- Agile Development
 - value creation and innovation
 - risk and complexity in software development
 - agile competence pyramid
- Principles and Practices
 - effective communication among stakeholders
 - project retrospectives, feedback techniques
 - ongoing requirements, solicitation and management
- Modern Software Engineering Methodologies
 - benefits/difficulties and comparison of different approaches (i.e. plan-driven, hybrid and agile)
 - implications for project management
 - incremental planning
- Research in Agile Development

Software Architectures

- Role of software architecture and software architects
 - reference models, reference architectures
 - architectural structures and views
 - software architecture documentation
- Advanced design concepts
 - the SOLID principles
 - Attribute Driven Design
 - design by contract
- Architectural patterns
 - for distributed architectures
 - architecture patterns vs design patterns
 - pattern styles
- Selection, creation, and evaluation of software architectures
 - quality attributes
 - architecture analysis methods
- Research in Software Architecture

Software Evolution

- Principles of Software Evolution
 - development, maintenance, evolution
 - software aging
 - Program comprehension
- Software Quality & Analysis
 - software quality metrics
 - software visualization
 - continuous quality control
- Evolution of Legacy Code
 - "Re"-Techniques: Reverse Engineering, Re-Engineering, Re-Factoring
 - object-oriented re-engineering
 - Testing legacy systems
- Research in Software Evolution

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

- Conception et programmation orientées selon l'objet dans plus d'un langage de programmation
- Unified Modeling (UML)
- Design Patterns: Elements of Reusable Object-Oriented Software (Gamma, Helm, Johnson, Vlissides; ISBN 0-201-63361-2)
- Notions de gestion des versions et des configurations
- Notions de tests unitaires (par exemple junit ou nunit)
- Connaissance de base de Scrum

Brève description du contenu et des objectifs

Le module fournit une étude approfondie des sujets sélectionnés dans le domaine du génie logiciel. Ces sujets sont issus des domaines suivants: méthodes de spécification, méthodes de développement agiles, architecture logicielle, évolution du logiciel.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- L'étudiant comprend et peut expliquer les avantages d'une méthodologie de développement itérative et incrémentale.
- En fonction des caractéristiques d'un projet donné, l'étudiant est en mesure de sélectionner, d'adapter et d'appliquer la méthodologie de développement appropriée.
- L'étudiant connaît des principes de conception et d'architecture avancés et peut les utiliser pour diriger la phase de conception d'un système.
- L'étudiant est conscient qu'un logiciel est un système complexe en évolution constante.
- L'étudiant sait comment améliorer, étendre et intégrer des logiciels existants, tout en maintenant leur qualité.

Contenu des modules avec pondération du contenu des cours

Génie Logiciel

- Principes et valeurs des méthodes de développement agiles
 - Création de valeur
 - Gestion du risque
 - Culture d'équipe
 - Relations clients
- Bonnes pratiques et techniques de gestion
 - Gestion de la communication entre parties prenantes
 - Revues de projets
 - Assurance qualité
 - Gestion des changements
 - Planification itérative et incrémentale
- Méthodologies de développement modernes
 - Vue d'ensemble et comparaison de différentes approches
 - Unified Process (UP), eXtreme Programming (XP), Scrum
 - Implications sur la gestion de projet

Architecture logicielle

- Le rôle de l'architecture est des architectes logiciels
 - notion d'architecture
 - modèles de référence, architectures de référence
 - structures et vues architecturales
 - architecture et documentation
 - les rôles de l'architecte logiciel
- Principes de conception avancés
 - interface-oriented design
 - couplage et cohésion
 - gestion des dépendances
 - les principes SOLID
 - conception par contrat
- Modèles de conception et d'architecture
 - styles d'architectures
 - modèles pour architectures distribuées
- Sélection, création et évaluation d'architectures logicielles
 - qualités systémiques
 - méthodes d'analyse

Evolution du logiciel

- Principes d'évolution
 - Développement, maintenance, évolution
 - "Software aging"
 - Compréhension du code
- Analyse et qualité du logiciel
 - métriques
 - techniques d'analyse et de visualisation
 - contrôle de qualité continu
- Evolution de code hérité
 - Re-Technologies: Reverse Engineering, Re-Engineering, Re-Factoring
 - Re-engineering orienté objet
 - Travailler efficacement avec du code hérité
 - Tester des systèmes hérités

Méthodes d'enseignement et d'apprentissage

travail personnel, lectures et exercices

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Understanding of the following concepts at the Bachelor of Science level

- Calculus
- Linear algebra
- Probability/Statistics
- Digital signal processing

Brief course description of module objectives and content

The goal of this module is to introduce the students to the powerful world of statistical digital signal processing. While at the bachelor level digital signal processing is most often taught with deterministic signals, in the real world most interesting signals are stochastic in nature. Hence in more advanced applications, such as prediction or noise removal, the theories presented in this module are essential.

The basic digital signal processing, linear algebra and probability theory necessary to understand the module are brushed-up at the beginning. Then stochastic processes are introduced which allows the proper formulation of the optimal filtering and spectral estimation problem later on. After an in-depth treatment of the optimal filtering and estimation problem, adaptive filters are introduced which are a popular choice for many advanced statistical digital signal processing problems.

Aims, content, methods

Learning objectives and acquired competencies

- The student becomes familiar with stochastic signals and systems
- The student understands and can apply the different methods for signal modeling
- The student has an in-depth understanding of Wiener filtering and knows how a discrete Kalman filter can be used to solve a stochastic filtering problem
- The student understands and can apply the different methods for spectrum estimation
- The student knows the most common adaptive filters and is able to select the proper one for the application at hand

Contents of module with emphasis on teaching content

The module starts with a review of basic digital signal processing, linear algebra and probability theory. It then introduces some concepts about stochastic processes, which are necessary to understand the following applications of statistical signal processing. Then the module discusses several different ways of signal modeling which can be used for parametric methods later on. Then one of the core topics is presented, which is the optimal linear mean square error estimation of a signal which is corrupted by additive noise. The module then presents a chapter about the very important topic of spectral estimation and finally concludes with the application of the learned theory for designing adaptive filters.

The available 14 weeks are organized as follows:

- 2 weeks: Background (review of digital signal processing and linear algebra)
- 3 weeks: Discrete-time random processes (including a review of probability)
- 2 weeks: Signal modeling
- 3 weeks: Wiener filtering (including the discrete Kalman Filter)
- 2 weeks: Spectrum estimation
- 2 weeks: Adaptive filtering

Teaching and learning methods

- A three hour session each week for 14 weeks
- The first hour is a homework review session where the homework is discussed. The homework is "paper and pencil" homework and small Matlab programming assignments
- The next two hours are lecture hours, where new theory is introduced

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Les principes fondamentaux en :

- Calcul
- Algèbre linéaire
- Probabilités/statistiques
- Traitement numérique du signal

Brève description du contenu et des objectifs

Le but de ce module est de présenter à l'étudiant une introduction au monde puissant du traitement statistique du signal. Alors qu'au niveau bachelors, l'enseignement du traitement numérique du signal se fonde principalement sur des signaux déterministes, dans le monde réel, les principaux signaux sont de nature aléatoire. Donc, dans les applications plus élaborées, comme la prédiction ou la suppression du bruit, les théories présentées dans ce module s'avèrent essentielles.

Le cours débutera par une remise à niveau des connaissances de bases du traitement numérique du signal, de l'algèbre linéaire et de la théorie des probabilités qui seront nécessaires pour comprendre le contenu de ce module. Ensuite seront introduits les processus stochastiques qui permettront ultérieurement la conception appropriée d'un filtrage optimal et du filtrage adaptatif.

Après l'approfondissement du problème de filtrage optimal, le cours introduira les filtres adaptatifs souvent utilisés dans la technologie avancée de traitement des signaux numériques. Dans le cadre de ce cours une introduction dans le domaine du Machine Learning par descente de gradient et réseau de neurones sera faite.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

- L'étudiant se familiarise avec les signaux et les systèmes aléatoires
- L'étudiant comprend et peut appliquer les différentes méthodes pour la modélisation du signal
- L'étudiant dispose d'une connaissance approfondie du filtrage de Wiener et sait comment utiliser un filtre Kalman pour résoudre un problème de filtrage stochastique
- L'étudiant comprend et peut appliquer différentes méthodes pour l'estimation spectrale
- L'étudiant connaît les filtres adaptatifs les plus répandus, il est également capable de sélectionner le plus approprié pour l'application concernée.

Contenu des modules avec pondération du contenu des cours

Le module débute par une révision des bases du traitement numérique du signal, de l'algèbre linéaire et de la théorie de la probabilité. Il se poursuit ensuite par une introduction aux concepts des processus stochastiques, qui sont nécessaires pour comprendre les applications dans le domaine du traitement statistique du signal. Puis le module aborde différentes possibilités de modélisation du signal qui peuvent être utilisées plus tard pour les méthodes paramétriques. Puis vient la présentation d'un des sujets essentiels à savoir : l'estimation optimale de l'erreur quadratique moyenne linéaire d'un signal qui est altérée par du bruit additionnel. Le module présente ensuite un chapitre sur le sujet très important qu'est l'estimation spectrale et se termine finalement par une application de la théorie apprise à la conception de filtres adaptatifs.

Les 14 semaines disponibles sont organisées comme suit:

- 2 semaines: Les acquis (révision du traitement numérique du signal et de l'algèbre linéaire)
- 3 semaines. Processus aléatoires à temps discret (y compris une révision des probabilités)
- 2 semaines: Modélisation du signal
- 3 semaines: Filtrage de Wiener (y compris le filtre Kalman discret)
- 2 semaines: Estimation spectrale
- 2 semaines: Filtrage adaptatif

Méthodes d'enseignement et d'apprentissage

- deux heures de cours magistral et une heure de pratique
- Devoirs sur papier et sur Matlab

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Linear algebra (matrices, eigenvalues, eigenvectors,...), linear differential equations.
- Dynamic equilibrium of a mechanical systems (mass, springs, dampers, natural frequencies,...)
- System Dynamic Analysis: stability and control
- Fourier transform.
- Entry-level experience with MATLAB/Simulink

Brief course description of module objectives and content

Structural vibrations: theoretical aspects, numerical modelling (Finite Element: reduced order models), experimental testing. Passive vibration control. Dynamic analysis of high performance machine tools.

Aims, content, methods

Learning objectives and acquired competencies

- Consolidate theoretical knowledge on structural vibrations
- Passive solutions for vibration alleviation: dynamic isolation, Tuned Mass Dampers
- Numerical modelling by lumped masses and Finite Elements (reduced order models)
- Experimental Modal Analysis

Contents of module with emphasis on teaching content

- Theory review: systems with one degree of freedom (DOF).
- Energy dissipation: viscous and hysteretic damping
- Dynamic modelling in matlab/Simulink
- Dynamic vibrations isolation
- Tuned Mass Dampers
- Theory review: multi-DOF systems. Eigen-frequencies and mode shapes. Modal coordinates
- Dynamic analysis by Finite Element modelling. Model reduction techniques: Modal and Craig Bampton.
- Experimental Modal Analysis: tools and basic methodologies. Impact hammer, shakers, accelerometers
- Dynamic response of mechanical structures in controlled systems. The case of Machine Tools.
- Vibrations in rotating machinery.

Teaching and learning methods

Frontal theoretical lessons with interaction. Self-developed numerical analysis in MATLAB/Simulink and Siemens Nastran NX.

Group project, possibly with test bench design.

Literature

Lecture notes.

TSM Technisch-wissenschaftliche Vertiefung

Lektionen

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Baustatik: gute Kenntnis baustatischer Methoden (Kraft- und Deformationsmethode)

Mathematik: Grundlagen der Bewegungs-Differentialgleichungen, der Fourieranalyse und der Matrizenrechnung

Physik: Grundlagen Kinematik und Kinetik des Massenpunktes

Kurzbeschreibung der Inhalte und Ziele

Der Modulinhalt ist in zwei Themengebiete, Baudynamik und Erdbebeningenieurwesen, untergliedert.

Die Baudynamik beinhaltet: Grundlagen der Kinematik und Kinetik des Massenpunktes; die Modellbildung von dynamischen Systemen und das Aufstellen der Bewegungsdifferentialgleichungen bei Ein- und Mehrmassenschwingern; die Berechnung der Systemantwort infolge dynamischer Einwirkungen; Massnahmen zur Reduzierung von Schwingungen.

Im aufbauenden Teil Erdbebeningenieurwesen folgt der erdbebengerechte Entwurf an Beispielen; Duktilität und Ermittlung von Antwortspektren; die Berechnung der Schnittkräfte mit Hilfe dem Ersatzkraft- und dem Antwortspektrenverfahren nach den SIA Tragwerksnormen; Grundlagen der verformungsbasierten Nachweise.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Baudynamik

Die Studierenden:

- kennen die Arten von dynamischen Einwirkungen
- können die Tragstruktur auf ein dynamisches System reduzieren bzw. übertragen (Modellbildung)
- können die Bewegungsgleichungen für Ein- und Mehrmassenschwinger aufstellen und die Systemantwort infolge der dynamischen Einwirkungen berechnen und plausibilisieren
- kennen Massnahmen zur Reduzierung der dynamischen Systemantwort (Systemsteifigkeit, Dämpfung, Tilger) und können diese auf einfache Systeme anwenden

Erdbebeningenieurwesen

Die Studierenden:

- kennen die seismologischen Grundlagen
- kennen die Grundlagen eines erdbebengerechten Entwurfs und können diese an Tragstrukturen umsetzen
- können die Auswirkungen (Schnittkräfte) infolge Erdbebanregung mit dem Ersatzkraft- und dem Antwortspektrenverfahren nach den SIA Tragwerksnormen für Baustrukturen berechnen.
- kennen den Einfluss der Duktilität auf die Systemantwort
- kennen die Grundlagen verformungsbasierter Nachweise und können diese auf ein einfaches System anwenden

Modulinhalt mit Gewichtung der Lehrinhalte

Baudynamik (Gewichtung 50%)

Kinematik und Kinetik des Massenpunktes; Einmassenschwinger - freie und erzwungene Schwingungen; Mehrmassenschwinger - modale Analyse, freie und erzwungene Schwingungen; Tilgersysteme; Rayleigh-Quotient

Erdbebeningenieurwesen (Gewichtung 50%)

Einführung seismologische Grundlagen; erdbebengerechter Entwurf an Beispielen; Schubmittelpunkt; horizontaler Lastabtrag; Duktilität und Antwortspektren; Ersatzkraft- und Antwortspektrenverfahren nach SIA 261; Einführung in verformungsbasierte Nachweisverfahren

Lehr- und Lernmethoden

Die Grundlagen werden mit Hilfe von Foliensätzen, ergänzt durch Tafelanschriebe, erläutert und diskutiert. Das Lösen von Beispielen erfolgt an der Tafel bzw. durch Erläuterungen mit Hilfe von Umdrucken. Das Wissen und die Kompetenzen werden durch das selbständige Lösen von Übungsaufgaben zum Themenbereich vertieft. Diese werden im Unterricht anschliessend besprochen.

Des Weiteren kommt eine speziell für die Themen entwickelte Lernsoftware (Freeware-NonLin) zum Einsatz, mit deren Hilfe die Studierenden die Systemantwort von einfachen Systemen bei verschiedenen dynamischen Einwirkungen berechnen und die Ergebnisse plausibilisieren können. Dieses ist auch zum Selbststudium sehr gut geeignet.

Modulkategorie

TSM Technisch-wissenschaftliche Vertiefung

Lektionen

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

- Grundlegende Kenntnisse in Landschaftsarchitektur, Städtebau oder Raumplanung
- Basiserfahrung in Planen und Entwerfen
- Grundlagen in Erörterung und Darstellung von Entwurfsaufgaben in Plänen und Berichten

Kurzbeschreibung der Inhalte und Ziele

Das Modul behandelt für die unterschiedlichen Vertiefungsrichtungen des Masterstudienganges die wichtigsten Entwurfs- und Planungsmethoden zur Arbeit in grösseren Räumen und mit unterschiedlichen Planungsmaassstäben, wie sie beispielsweise in Agglomerationsräumen und siedlungsnahen Frei- und Erholungsräumen zur Anwendung kommen können. Theoretisches Wissen wird fortlaufend mit aktuellen Beispielen aus der Praxis

abgeglichen. Besonderes Interesse gilt sowohl der Vielfalt wie auch der Kongruenz der Methoden in den verschiedenen Planungsrichtungen und auf den verschiedenen Massstabebenen. In diesem Sinne werden im Modul interdisziplinäre und spezialisierte Gestaltungskompetenzen in Planung, Konzeption und Projektierung vermittelt.

Das Modul behandelt mit Schwerpunkt in der Landschaftsarchitektur, speziell der Freiraum- und Landschaftsplanung insbesondere Ansätze zum ‚konzeptionellen Entwurf‘ und geht dabei auf Aspekte der Raumplanung und des Städtebaus ein. Damit kann es neben der Vertiefung in Landschaftsarchitektur auch einen besonderen Gewinn für Studierende der Raumentwicklung, des Städtebaus und der Verkehrsplanung darstellen und deren ‚Freiraum- und Landschaftskompetenz‘ erweitern.

In den Übungen werden in der Tradition der Stegreife sogenannte „Instant-Entwürfe“ bearbeitet. Aufgabe in diesen Instant-Arbeiten ist es, sich der integralen Gestaltung der bebauten und nichtbebauten Umwelt auf innovative Art und Weise zu nähern. Dabei ist die Erfahrung wichtig, dass sowohl Formen und Strukturen im grossen Massstab, grössere Räume im kleinen Massstab, als auch Nutzungen, Prozesse und Aufgabenstellungen gestaltet werden können.

Die Übungen haben das Ziel, Ihre Entwurfskompetenz zu fördern sowie ein breites Verständnis von Entwurfs- und Planungsaufgaben zu erlangen. Sie sind am Ende des Moduls in der Lage, räumliche Entwicklungsvorstellungen wirksam bildhaft zu vermitteln und zu konkretisieren und sich mit sicherer ‚entwerferischer Hand‘ den Fragestellungen zu nähern, als auch sich Planung und Entwurf als System zu erkennen und für deren Lösung adäquate Prozesse vorzuschlagen.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Fachliche Ziele:

- Kenntnisse über aktuelle Theorien und Methoden in Planung und Entwurf sowie über deren Bedeutung in aktuellen Planungsaufgaben. Damit die Kompetenz, die Aufgabenstellungen mit den dafür geeigneten Methoden zu organisieren.
- Kenntnisse über die aktuelle Praxis sowie die Kompetenz, neue Aufgabenstellungen an Best-Practice zu messen und dementsprechend anspruchsvolle Prozesse in die Wege zu leiten.
- Verstärken der gestalterischen Kompetenz und diese wirksam in kleinmassstäbliche Entwurfsprozesse / Planung grösserer Räume einbringen.
- Kompetenz, sich in interdisziplinären Entwicklungsaufgaben kompetent einbringen zu können und mit anderen beteiligten Entwerfenden und Planungsspezialisten kommunizieren zu können.
- Innovativ selbstständig sowie auch team-orientiert anspruchsvolle Planungsaufgaben bearbeiten können

Methodische Ziele:

- Fähigkeit, unterschiedliche Anforderungen beteiligter Akteure zu systematisieren und in einem übergeordneten Gestaltungsprozess einzubinden und wirksam zu machen.
- Fähigkeit, in komplexen Gestaltungsprozessen, Aufgaben (oder Teilaufgaben) an spezialisierte Beteiligte zu delegieren.

Modulinhalt mit Gewichtung der Lehrinhalte

- Teil 1: Grundverständnis Landschaft, Planungstheorien und -Methodik, Instrumente
 - Teil 2: Entwurfstheorien im städtebaulichen und freiraumplanerischen Entwerfen
 - Teil 3: Gestalterische Kriterien und Landschaftsziele, komplexe Planungs- und Entwurfsmethoden, Zukunfts- und Leitbilder, Multifunktionalität
 - Teil 4: konzeptioneller Entwurf in Agglomerationsräumen, interdisziplinäre Zusammenarbeit beim Planen und Entwerfen
 - Teil 5: Prozessgestaltung und Partizipation
-
- Teil 1: Einführung / Planungstheorien 2 Wochen
 - Teil 2: Einführung / Entwurfstheorien 2 Wochen
 - Teil 3: komplexe Planungs- und Entwurfsprozesse ca. 4 Wochen
 - Teil 4: konzeptioneller Entwurf in Agglomerationsräumen ca. 3 Wochen
 - Teil 5: Prozessgestaltung und Partizipation ca. 3 Wochen

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Optics: Basics of wave and geometrical optics;
- Physics basics for engineers
- Analysis and linear algebra on FH bachelor level recommended

The students are required to fill possible gaps by self-study. Students without basic knowledge in optics are requested to complete the EVA module "Fundamentals of Light" prior to the "Advanced Thin Film Technology" TSM module.

Brief course description of module objectives and content

The Technology of thin films is a core element in the design and fabrication of photonic components. The objective of the module "Advanced Thin Film Technology" is the introduction to this important technology and to the applications of thin films in the field of photonics with the focus on optical coatings. This includes the design and fabrication of thin films as well as the characterization of their physical properties.

Aims, content, methods

Learning objectives and acquired competencies

The students

- are familiar with the main deposition and structuring methods used in thin film technology. They know the advantages and drawbacks of the different methods and are able to select a suitable method for a given thin film design
- know important microstructural, chemical, mechanical, optical, electrical and thermal properties of thin films and are familiar with the relevant methods used in industry to characterize these properties
- understand the main physical concepts related to the application of thin films in photonics and are able to solve simple problems involving thin layers. They are able to perform calculations and evaluations of optical coating designs.
- know the most important applications of thin layers in passive and active devices

Contents of module with emphasis on teaching content

There will be several thematic blocks. Although several different types of thin layers will be discussed, the focus will be set on optical coatings:

- Fabrication methods (~3 weeks)
 - A detailed discussion of deposition methods, with the focus on the following deposition method categories: Physical evaporation, Plasma enhanced physical and chemical deposition, liquid phase deposition
 - A rough introduction to structuring methods such as photo-, e-beam and imprint lithography, plasma assisted physical – and chemical dry etching, wet etching, lift-off
- Properties and characterization methods of thin films (~4 weeks)
 - Properties such as morphology, microstructure, optical and electric properties, chemical and mechanical properties
 - Methods such as atomic force microscopy and profilometry, optical and electron microscopy, focused ion beam, x-ray analytical methods, ion beam based methods (SIMS, RBS) as well ellipsometric and spectroscopic methods
- Physics of thin films (~4 weeks)
 - Optical properties:
 - Behavior of radiation in thin layers and at layer interfaces
 - Reflection, transmission and absorption properties of thin layers and multilayer stacks
 - Material diffusion in thin layers
 - Mechanical behavior and adhesion of thin films
- Applications (~3 weeks)
 - Coatings designs for optical components such as lenses, mirrors and filters
 - Planar wave guide structures, gratings or plasmonic structures
 - Thin films in photonic devices

Teaching and learning methods

Will be defined by the lecturers

Literature

- Materials Science of Thin Films, 2nd edition, Milton Ohring, Academic Press

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Students should have a keen interest in transport phenomena and their description and modelling. Advanced knowledge of thermodynamics, fluid dynamics, heat transport and applied mathematics (ordinary and partial differential equations, algebraic equations, integral calculus) is of great benefit for students.

Brief course description of module objectives and content

This module deals with transport phenomena at postgraduate level with a focus on technical problems in material, heat and momentum transport, especially in the environment of multiphase flows. Working on the basis of conservation principles, transport equations are derived in a general form. In order to obtain closed solutions for specific problems, the general balance equations are combined with material laws and also with initial and boundary conditions. This then highlights the analogies and relations between transport phenomena in different technical fields. In this way, students expand the knowledge and skills in thermodynamics, fluid dynamics and heat transport that they have acquired during their

undergraduate studies and apply them to solving technical problems of practical relevance.

Aims, content, methods

Learning objectives and acquired competencies

Upon successful completion of the module

- students are familiar with the most important phenomena of mass, heat and momentum transport (this is the aim pursued in contact teaching, in particular.)
- the students can independently study similar topics in greater depth (this is the aim pursued through the self-study of selected chapters, in particular.)
- students are able to apply the methods covered to actual technical problems (this is the aim of the exercises between the contact lessons, in particular.)
- students are in a position to conduct analyses independently.

Contents of module with emphasis on teaching content

The first half deals with general transport phenomena (with the focus on mass transport).

The second half covers phenomena with multiphase flows.

Teaching and learning methods

Frontal teaching, incorporating examples (lectures with 3 lessons)

Self-study of selected chapters from different sources

Between the lectures, exercises are to be solved; these will, if necessary, be discussed in class afterwards.

Literature

Experience has shown that the subjects cannot be covered by a single book. Instead, students are told to consult various books.

Selected sources are made available electronically:

- presentations from frontal teaching
- selected chapters from textbooks
- selected original works

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Les étudiantes et étudiants doivent témoigner d'un vif intérêt pour les phénomènes de transport ainsi que pour leur description et leur modélisation. Des connaissances approfondies en thermodynamique, en dynamique des fluides ainsi qu'en mathématiques appliquées (équations différentielles ordinaires et partielles, équations algébriques, calcul intégral) représentent un avantage considérable.

Brève description du contenu et des objectifs

De niveau post-diplôme, ce module traite des phénomènes de transport en mettant l'accent sur les problèmes techniques surgissant dans le transport de substances, de chaleur et d'impulsions, en particulier dans des écoulements diphasiques. À partir des principes de conservation, on dérive des équations de transport d'ordre général. Pour obtenir des solutions analytiques aux problèmes spécifiques, on combine des équations de bilan générales avec les propriétés des substances ainsi qu'avec les conditions initiales et limites. Cette démarche a pour effet de mettre en évidence les analogies et les relations entre les phénomènes de transport des divers domaines techniques.

Les étudiantes et étudiants élargissent ainsi les connaissances et aptitudes acquises au cours de leurs études de base en thermodynamique, dynamique des fluides et transport de chaleur; ils sont par ailleurs capables de les appliquer dans la pratique pour résoudre des problèmes techniques.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Après avoir accompli avec succès ce module, les étudiantes et étudiants

- connaissent les phénomènes les plus importants survenant dans le transport des substances, de la chaleur et des impulsions (un objectif que se propose d'atteindre l'enseignement en classe)
- sont capables d'approfondir des thématiques similaires de manière autonome (un objectif qu'a surtout l'étude individuelle de certains chapitres sélectionnés)
- savent appliquer les méthodes étudiées à des problèmes techniques concrets (un objectif que se proposent d'atteindre les exercices et devoirs à effectuer entre les leçons en classe)
- sont en mesure d'effectuer des analyses en toute autonomie

Contenu des modules avec pondération du contenu des cours

Au cours de la première moitié sont traités les phénomènes de transport généraux (avec comme élément essentiel, le transport des substances). La seconde moitié est consacrée à l'étude des phénomènes d'écoulements polyphasiques.

Méthodes d'enseignement et d'apprentissage

Cours magistral accompagné d'exercices (cours de 3 leçons)

Étude individuelle de certains chapitres choisis, extraits de diverses sources

Entre les cours magistraux, des exercices et des études de cas doivent être résolus, qui sont ensuite discutés en cours, si nécessaire.

Bibliographie

L'expérience montre que l'ensemble de ce sujet ne peut être couvert par un seul livre: à défaut, les étudiantes et étudiants sont donc renvoyés à plusieurs ouvrages. Une sélection de sources sera mise à leur disposition électroniquement.

- Présentations de l'enseignement magistral
- Choix de chapitres extraits de manuels de cours
- Choix de travaux originaux

Evaluation

2 Lektionen und 1 Übungslektion pro Woche

Eintrittskompetenzen

Vorkenntnisse, Eingangskompetenzen

Vorkenntnisse in einem Teilbereich der räumlichen Planung, z.B. Raumplanung, Landschaftsarchitektur, Geografie, Verkehrsplanung oder in Bauingenieurwesen, Architektur, Betriebswirtschaft

Kurzbeschreibung der Inhalte und Ziele

Das Modul behandelt die Zusammenhänge von Siedlungsentwicklung und Mobilität auf den verschiedenen Planungsebenen. Zielsetzungen und Umsetzungsmöglichkeiten einer nachhaltigen Mobilität sind dabei zentrale Themen. Die Möglichkeiten und Effekte eines nachhaltig wirksamen Mobilitätsmanagements werden anhand von Beispielen thematisiert.

Ziele, Inhalte, Methoden

Lernziele, zu erwerbende Kompetenzen

Den Studierenden soll folgendes vermittelt werden:

- Grundlagenwissen im Themenbereich Mobilität und Siedlungsplanung
- Beurteilungsmassstäbe für Fragestellungen der Raum- und Verkehrsplanung
- Instrumente und Verfahren der Verkehrsplanung

In den Übungsteilen sollen die Studierenden folgende Kompetenzen erreichen:

- Befähigung zum Erkennen von Zielkonflikten im Bereich Siedlung-Mobilität
- Überblick über raumstrukturelle Charakteristiken der Siedlungsplanung erhalten
- Bewusstseinsbildung für das Thema „nachhaltige Mobilität“ auf den Ebenen der Verkehrs- und Siedlungsplanung
- Befähigung zur Entwicklung konzeptioneller Lösungen im Bereich Mobilität, Verkehr und Transport

Die Studierenden kennen und verstehen:

- die Ebenen, Strukturen und Planungsschritte der Verkehrsplanung
- konzeptionelle und prozessuale Ansätze der Verkehrs- und Siedlungsplanung
- die wesentlichen Zusammenhänge zwischen Mobilität und Siedlung
- planerische, technologische und infrastrukturelle Bausteine einer nachhaltigen Mobilität

Die Studierenden sind in der Lage,

- komplexe Probleme im Bereich Siedlung und Mobilität zu erfassen
- Planungsaufgaben zu verstehen und Problemlösungen nachzuvollziehen

Modulinhalt mit Gewichtung der Lehrinhalte

Grundlagen

- Aktueller Wissens- und Forschungsstand
- Zusammenhänge zwischen Raumentwicklung und Mobilität
- Einflussfaktoren der Mobilität
- Mobilitätsverhalten und Verkehrsmittelwahl
- Nachhaltige Mobilität und Raumentwicklung

Siedlungsentwicklung

- Historische und aktuelle Raumtheorien
- Modelle und Konzepte im Fokus von Zentralität, Urbanität und Identität
- Zukunftsfähige Siedlungsstrukturen
- Raum- und Bautypologien in Theorie und Praxis
- Planerische Grundlagen zum nachhaltigen Umgang mit Dichte, Mischung und Nutzflächenbedarf
- Stadtverkehrskonzepte
- Parkraumkonzepte und Parkraummanagement

Standortplanung und Standortentwicklung

- Standortevaluation und Standortbewertung
- Verkehrserzeugung von Nutzungstypen
- Beurteilung der Verkehrsauswirkungen
- Bewertung der Umweltverträglichkeit
- Verkehrserschliessung
- Konzepte für verkehrsintensive Nutzungen

Mobilitätsmanagement

- Bausteine nachhaltiger Mobilität
- Mobilitätsdienstleistungen und -angebote
- Kommunale, standortbezogene und betriebliche Mobilitätskonzepte
- Massnahmenpakete für den Freizeit- und Einkaufsverkehr
- Wirkungen und Effekte von Massnahmen

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

- Basic principles of human cognition and human-machine interaction
- Basic knowledge of graphical user interfaces and frameworks corresponding to chapters 1-5, 7-8, 11 from Markus Dahm, "Grundlagen der Mensch-Computer-Interaktion", Pearson Studium, ISBN 3-8273-7175-9, 2006

Brief course description of module objectives and content

Graphical User Interfaces have long become standard UIs for computers, and mobile devices have not only adopted these GUIs but augmented them with multi-touch screens, speech in- and output, gesture and handwriting recognition as well as several additional sensors. This has fostered innovative ways of user interaction with the information available on these devices that were only seen in professional environments so far. In the professional environment the trend has further developed into more and more immersive systems where the user dives more or less completely into a virtual world in order to efficiently interact with the vast amount of available information. In these scenarios, haptic interaction plays a major role. This module gives a solid introduction into the fundamental concepts and techniques of both advanced user interfaces with different input and output channels and interaction modalities as well as immersive systems with haptic interaction. Insight into the development of these advanced user interfaces and immersive systems will be given through hands-on exercises and a lab visit.

Aims, content, methods

Learning objectives and acquired competencies

Students attending this module

- have complemented their knowledge about the user-centered GUI design process and its major activities
- are familiar with a wide range of non-standard and advanced user interfaces and can discriminate and explain their characteristics, strengths and limitations
- possess a sound knowledge of the principles and (potential) application areas of non-standard user interfaces such as voice, gesture-based or haptic user interfaces as well as immersive systems and technologies
- know the required components and underlying technologies for these advanced user interfaces and are able to evaluate and design simple applications
- have extended their knowledge of user-centred design and usability to environments and applications using non-standard user interfaces and can evaluate their suitability for specific tasks or projects

Contents of module with emphasis on teaching content

- The User-Centered Design Process (15%)
 - Fundamentals of Human-Computer Interaction (Recapitulation/Convergence)
 - UI Requirements Elicitation & Analysis: Stakeholders, Users, Business, Tasks and Context
 - UI Design & Evaluation: Principles, Patterns, Guidelines, and Techniques
 - Aligning with the Software Engineering process
- Recognition Based User Interfaces (50%)
 - Fundamentals of recognition-based UIs (Hidden-Markov Models, Deep Neural Networks)
 - Conversational User Interfaces
 - Gesture Recognition, Handwriting Recognition
 - Multimodal Interfaces, Brain Computer Interface
- Immersive Systems (35%)
 - Fundamentals of Virtual Reality (VR), Augmented Reality (AR) and Mixed Reality (MR) systems.
 - Technology for VR applications (human depth perception, 3D stereoscopic and volumetric displays, tracking and motion capturing technologies, locomotion interfaces)
 - Introduction to 3D computer graphics (rendering pipeline, photo-realistic and non-photo-realistic rendering, ray-tracing, particle systems, volume rendering)
 - Computer Haptics (human haptic perception, computer haptic interfaces, haptic rendering and applications)

Compétences préalables

Connaissances préalables, compétences initiales

- principes de base de la connaissance humaine et de l'interaction homme-machine
- connaissance de base des interfaces utilisateurs graphiques et des structures graphiques correspond aux chapitres 1-5, 7-8, 11 de Markus Dahm, "Grundlagen der Mensch-Computer-Interaktion", Pearson Studium, ISBN 3-8273-7175-9, 2006 "Fondements de l'interaction homme-ordinateur"

Brève description du contenu et des objectifs

Les interfaces utilisateurs graphiques sont devenues depuis longtemps des interfaces utilisateurs courantes pour les ordinateurs et les appareils portatifs, elles ont non seulement adopté ces IUG, mais les ont agrémentées d'écrans multi-touches, d'entrées et sorties vocales, de reconnaissance gestuelle et de l'écriture manuscrite, ainsi que de nombreux autres capteurs complémentaires. Cela a favorisé le développement de modes d'interaction totalement nouveaux avec l'utilisateur grâce à la disponibilité de données à l'écran, qui jusque-là n'apparaissaient que sur des environnements professionnels. L'environnement professionnel s'est orienté vers le développement de systèmes de plus en plus immersifs qui amènent l'utilisateur à plonger plus ou moins totalement dans un monde virtuel pour interagir efficacement avec la quantité importante d'informations disponibles. Dans ces scénarios, l'interaction tactile joue un rôle majeur.

Ce module présente une introduction approfondie aux techniques et concepts fondamentaux des interfaces utilisateurs avancées dotées de différents canaux d'entrée-sortie et modes d'interaction, mais aussi des systèmes immersifs avec interaction tactile. L'enseignement s'intéressera au développement de ces interfaces utilisateur avancées ainsi que des systèmes immersifs à travers des exercices à remettre et une visite de laboratoire.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

Les étudiants participant à ce module

- étendront leurs connaissances sur la procédure de conception des IUG orientées sur l'utilisateur et ses activités principales
- ont une bonne connaissance des interfaces non standard et avancées et peuvent en distinguer et en expliquer les caractéristiques, les points forts et points faibles
- possèdent de solides connaissances sur les principes et les domaines d'application (potentiels) des interfaces utilisateurs non-standard, telles que les interfaces utilisateurs basées sur la voix, le geste ou interfaces tactiles, ainsi que les systèmes et technologies immersifs
- connaissent les composants nécessaires ainsi que les technologies sous-jacentes à de telles interfaces utilisateurs et sont capables d'évaluer et de concevoir des applications simples
- ont élargi leurs connaissances de la conception centrée sur l'utilisateur et son usage sur des environnements et des applications faisant appel à des interfaces utilisateur non standard, ils sont également capables d'en vérifier l'adéquation pour des projets ou des missions spécifiques

Contenu des modules avec pondération du contenu des cours

- Démarche de conception centrée sur l'utilisateur (15%)
 - fondements de l'interaction homme-ordinateur (récapitulation/convergence)
 - élévation et analyse des exigences de l'IU: parties prenantes, utilisateurs, activité, tâches et contexte
 - conception et évaluation de l'interface utilisateur: principes, modèles, directives et techniques
 - alignement sur la procédure d'ingénierie logicielle
- interfaces utilisateurs basées sur la reconnaissance (50%)
 - principes de l'interface utilisateur basée sur la reconnaissance (Hidden-Markov Models, Deep Neural Networks)
 - interfaces conversationnelles
 - reconnaissance du geste, reconnaissance de l'écriture manuscrite
 - interfaces multimodales, interface cerveau ordinateur
- systèmes immersifs (35%)
 - principes des systèmes de réalité virtuelle, augmentée et mixte.
 - technologie pour des applications de réalité virtuelle (perception de la profondeur humaine, affichages stéréoscopiques 3D et volumétriques, technologies de pistage et captage du mouvement, interfaces de locomotion)
 - introduction au graphisme 3D assisté par ordinateur, (rendu pipeline, rendu photo-réaliste et non photo-réaliste, lancer de rayons, système à particule, rendu de volume)
 - technologie haptique (perception de la haptique humaine, interface haptique numérique, rendu haptique et applications)

Méthodes d'enseignement et d'apprentissage

- ex cathedra
- étude autonome de la bibliographie et des publications
- exercices pratiques

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences**Prerequisites, previous knowledge**

Basics in chemistry and physics

Brief course description of module objectives and content

The student learns the mechanical, chemical and biological processes used for environmental engineering (wastewater treatment). The course covers chemical, physical and biological treatment technologies. Furthermore, the topic of water reuse (greywater) and nutrient recovery is lectured.

Aims, content, methods

Learning objectives and acquired competencies

Knowing the classical areas of environmental technology, namely the sustainable treatment of

- Wastewater and
- reuse and nutrient recovery from wastewater

Wastewater:

- Know different applied wastewater treatment technologies and be able to identify their pros and cons.;
- Insides of technological aspects of the different technologies;
- Knowledge acquisition on the adequate technology for different wastewater compositions;

Reuse and nutrient recycling

- Know the importance of nutrient recovery;
- Know the available technologies for nutrient recovery in wastewater treatment;
- Acquire know-how on water reuse and application with case studies

Contents of module with emphasis on teaching content

- Introduction: (1/3)
 - Overview water management Switzerland/Global
 - Wastewater treatment essentials (WWTP visit)
 - Fundamentals of chemical, physical and biological wastewater treatment
- Water treatment (municipal and industrial) technologies (2/3)
 - Physical and chemical wastewater treatment technologies
 - Biological Nutrient Removal technologies
 - Technologies for the elimination of emerging contaminants (Micropollutants)
- Water recycling and nutrient recovery (3/3)
 - Water reuse (Greywater reuse, Drinking water)
 - Nutrient recovery (P, N)

Teaching and learning methods

Front lecturing (theory) with open discussion and classworks

Literature

- Slides given at the course from the Lecturer;
- Tchobanoglous et al. (2003) Wastewater Engineering Treatment and Reuse, Metcalf & Eddy, McGraw Hill, 4th Edition.

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

The students are expected to have knowledge on the basic modulation schemes including amplitude, frequency and phase.

They must also have studied the fundamentals of coding techniques. Other required competences that may be acquired through personal work are statistics, probabilities, wave theory, Fourier analysis and the OSI reference model.

Brief course description of module objectives and content

The module starts with the basics of the Physical and Data Link layers of advanced wireless systems.

Then the students will be exposed to the definition or functioning of a selection of the most important wireless standards at the present time. The focus will be on the physical layer and the medium-access layer.

Exercises will be used throughout the course to exemplify the use and application of the learnt material to compare the existing standards for a given problem in the context of the merits and limitations of each technology.

Aims, content, methods

Learning objectives and acquired competencies

The student will be able to

- discriminate between the various advanced modulation, coding and transmission concepts and explain their benefits and limitations
- explain the key characteristics of a selection of the most important wireless standards at the present time in regards to the Physical and Data Link layers
- find specific information in the standardisation documents

select the most suitable wireless technology for a practical problem.

Contents of module with emphasis on teaching content

Common Fundamentals (25%)

Applications, requirements, market and frequency spectrum issues in wireless communications. Wireless receivers and transmitters. Digital modulation and coding. Radio propagation.

Standards(75%)

Introduction to a selection of the most important standards at the time of the course (the actual technologies taught may differ somewhat from this list) :

- GPS
- RFID
- WLAN / Bluetooth
- GSM / UMTS / LTE
- DAB / DVB

etc.

Teaching and learning methods

- Lectures
- Work through exercises or perform simulations under supervision
- Self-study:
- completion of exercises
- research using the standards documents, online and library resources

analysis of case studies

Examen		X F 100% X E 100%		X E 100%

Catégorie de module

TSM approfondissement technico-scientifique

Leçons

2 leçons et 1 leçon de pratique par semaine

Compétences préalables

Connaissances préalables, compétences initiales

Les étudiants sont supposés avoir des connaissances sur les systèmes de modulation fondamentaux, incluant la modulation d'amplitude, de fréquence et de phase. Ils doivent également avoir étudié les bases des techniques de codage.

Par leur travail personnel, les étudiants acquerront également des connaissances sur les statistiques, les probabilités, la théorie des ondes, l'analyse de Fourier et le modèle de référence OSI.

Brève description du contenu et des objectifs

Le module débute par les bases sur les couches physiques et les couches liaison de données des systèmes sans fil avancés. Puis les étudiants seront confrontés à la définition ou au fonctionnement d'une sélection de standards sans fil les plus répandus à l'heure actuelle. L'accent sera mis sur la couche physique et la sous-couche Mac.

Des exercices seront pratiqués tout au long du cours pour illustrer l'utilisation et l'application du matériel étudié et le comparer aux standards existants dans le cadre d'une problématique donnée et comprendre les avantages et les limites de chaque technologie.

Objectifs, contenus, méthodes

Objectifs d'apprentissage, compétences à acquérir

L'étudiant-e pourra

- faire la différence entre différents concepts de modulation avancée, de codage et de transmission et expliquer leurs avantages et inconvénients.
- expliquer les principales caractéristiques pour une sélection de standards sans fil les plus répandus du marché en termes de couche physique et de couche liaison de données
- trouver des informations spécifiques dans les documents de normalisation
- choisir la technologie sans fil la plus adaptée face à un cas pratique

Contenu des modules avec pondération du contenu des cours

Bases fondamentales (25%)

Communications sans fils: applications, exigences techniques et légales, questions du spectre de fréquences. Emetteurs et récepteurs sans fil. Modulations numériques et codage. Propagation radio.

Standards(75%)

Introduction à une sélection de standards les plus répandus au moment du cours (il se peut que les technologies réellement enseignées diffèrent un peu de la liste ci-dessous):

- GPS
- RFID
- WLAN/Bluetooth
- GSM/ UMTS/ LTE
- DAB/ DVB
- etc.

Méthodes d'enseignement et d'apprentissage

- Périodes de cours
- Exercices ou simulations supervisées
- Travail personnel:
 - résolution d'exercices
 - recherche à l'aide des normes ressources en ligne et en bibliothèque
 - analyse d'études de cas

Aims, content, methods.....	464

Assessment.....	464
TSM_StrucEng: Baudynamik und Erdbebeningenieurwesen (DE).....	466
Allgemeine Angaben.....	466
Eintrittskompetenzen.....	466
Kurzbeschreibung der Inhalte und Ziele.....	467
Ziele, Inhalte, Methoden.....	467
Bewertung.....	468
TSM_TheoPlan: Entwerfen und Planen in grösseren Räumen – Theorie und Praxis (DE).....	469
Allgemeine Angaben.....	469
Eintrittskompetenzen.....	469
Kurzbeschreibung der Inhalte und Ziele.....	469
Ziele, Inhalte, Methoden.....	470
Bewertung.....	471
TSM_ThinFilm: Advanced thin film technology (EN).....	472
General Information.....	472
Entry level competences.....	472
Brief course description of module objectives and content.....	473
Aims, content, methods.....	473
Assessment.....	473
TSM_TwoPhase: Two-phase flows with heat and mass transport (EN).....	475
General Information.....	475
Entry level competences.....	475
Brief course description of module objectives and content.....	475
Aims, content, methods.....	476
Assessment.....	476
TSM_TwoPhase: Écoulements diphasiques et transport de chaleur et des substances (FR).....	477
Informations générales.....	477
Compétences préalables.....	477
Brève description du contenu et des objectifs.....	477
Objectifs, contenus, méthodes.....	478
Evaluation.....	478
TSM_Urban: Siedlung und Verkehr (DE).....	480
Allgemeine Angaben.....	480
Eintrittskompetenzen.....	480
Kurzbeschreibung der Inhalte und Ziele.....	480
Ziele, Inhalte, Methoden.....	481
Bewertung.....	482
TSM_Uselnf: Advanced User Interfaces (EN).....	483
General Information.....	483
Entry level competences.....	483
Brief course description of module objectives and content.....	484
Aims, content, methods.....	484
Assessment.....	484
TSM_Uselnf: Interfaces utilisateurs avancées (FR).....	486
Informations générales.....	486
Compétences préalables.....	486
Brève description du contenu et des objectifs.....	487

Objectifs, contenus, méthodes.....	487
Evaluation.....	488
TSM_WWTreat: Environmental Technologies: Wastewater Treatment (EN).....	489
General Information.....	489
Entry level competences.....	489
Brief course description of module objectives and content.....	489
Aims, content, methods.....	490
Assessment.....	490
TSM_WireCom: Wireless Communications (EN).....	492
General Information.....	492
Entry level competences.....	492
Brief course description of module objectives and content.....	492
Aims, content, methods.....	493
Assessment.....	494
TSM_WireCom: Systèmes de communication sans fil (FR).....	495
Informations générales.....	495
Compétences préalables.....	495
Brève description du contenu et des objectifs.....	495
Objectifs, contenus, méthodes.....	496
Evaluation.....	496
INDEX.....	498
