

**Module Description, available in: EN**

## *Machine Learning in Computer Vision*

**General Information****Number of ECTS Credits**

3

**Module code**

TSM\_CompVis

**Valid for academic year**

2024-25

**Last modification**

2018-11-06

**Coordinator of the module**

Thomas Koller (HSLU, thomas.koller@hslu.ch)

**Explanations regarding the language definitions for each location:**

- Instruction is given in the language defined below for each location/each time the module is held.
- Documentation is available in the languages defined below. Where documents are in several languages, the percentage distribution is shown (100% = all the documentation).
- The examination is available 100% in the languages shown for each location/each time it is held.

	Lausanne			Lugano	Zurich		
<b>Instruction</b>					X E 100%		
<b>Documentation</b>					X E 100%		
<b>Examination</b>					X E 100%		

**Module Category**

TSM Technical scientific module

**Lessons**

2 lecture periods and 1 tutorial period per week

**Entry level competences****Prerequisites, previous knowledge****Prerequisites:**

- Basic knowledge of machine learning (e.g. Andrew Ng's ML course on Coursera)
- Good command of an imperative programming language, basic knowledge of Python (the module will use Python 3).
- <http://www.scipy-lectures.org/index.html> Sections 1.1, 1.2, 1.3, 3.6.1, 3.6.2
- Basic knowledge of probability, statistics, linear algebra (vectors, matrices)
- Students are expected to take their laptops for the Lab activities

**Brief course description of module objectives and content**

Analyzing images is a very complex task that has many important real-world applications. This module presents powerful techniques to extract information from images and 3D data, based on machine learning and deep learning methods. These methods are mostly used as "black boxes" and their inner workings are not discussed in much detail. The module provides an overview of many image analysis applications such as document

analysis, medical imaging and autonomous driving; examples of advanced uses of deep learning on images (generative networks for image synthesis, adversarial networks, neural style transfer) are also discussed.

## Aims, content, methods

### Learning objectives and acquired competencies

- Students know how images and 3D data are represented and manipulated by software
- Students know the most important problems related to image analysis: e.g. image classification, segmentation and object detection and tracking
- Students can apply machine learning and deep learning techniques to solve image-related problems, and deal with practical issues arising in the field (dataset engineering, data augmentation, data normalization)
- Students have seen different examples of image analysis problems and common solution techniques, and are able to acquire additional expert knowledge from the scientific literature and online resources

### Contents of module with emphasis on teaching content

- Introduction
- Basic image processing methods applied to document processing: binarization; segmentation of text into lines, words and characters; connected component analysis.
- Image classification
  - applications to OCR: handcrafted features; convolutional neural networks.
  - Image classification with small datasets: data augmentation techniques; one-shot learning; transfer learning and pre-trained models.
- Segmentation
  - applications to medical images (2D, 3D)
  - fully convolutional networks for semantic segmentation.
- Object detection
  - face detection with cascading classifiers
  - pedestrian detection for autonomous driving
  - object tracking in videos.
- Generative models and Image Synthesis
  - Applications to Image Inpainting;
  - Generative Adversarial Networks;
  - Neural style transfer.

### Teaching and learning methods

Classroom teaching; programming exercises using python and frameworks in python

### Literature

- Computer Vision: Algorithms and Applications, Richard Szeliski, 2010
- Deep Learning with Python, Francois Chollet, early 2018, Sections 5, 8.3, 8.5

## Assessment

### Certification requirements

Module uses certification requirements

### Certification requirements for final examinations (conditions for attestation)

75% of homework passed

### Basic principle for exams

**As a rule, all the standard final exams for modules and also all resit exams are to be in written form**

### Standard final exam for a module and written resit exam

Kind of exam

written

Duration of exam

120 minutes

**Permissible aids**

*Aids permitted as specified below:*

**Permissible electronic aids**

No electronic aids permitted

**Other permissible aids**

10 A4 pages (2 sided)

**Special case: Resit exam as oral exam**

**Kind of exam**

oral

**Duration of exam**

30 minutes

**Permissible aids**

No aids permitted
