

Module Description, available in: EN

Two-phase flows with heat and mass transport

General Information
Number of ECTS Credits
3
Module code
TSM_TwoPhase
Valid for academic year
2024-25
Last modification
2021-02-12
Coordinator of the module
Daniel Weiss (FHNW, daniel.weiss@fhnw.ch)
Explanations regarding the language definitions for each location:

- Instruction is given in the language defined below for each location/each time the module is held.
- Documentation is available in the languages defined below. Where documents are in several languages, the percentage distribution is shown (100% = all the documentation).
- The examination is available 100% in the languages shown for each location/each time it is held.

	Lausanne			Lugano	Zurich		
Instruction					X E 100%		
Documentation					X E 100%		
Examination					X E 100%		

Module Category

TSM Technical scientific module

Lessons

2 lecture periods and 1 tutorial period per week

Entry level competences

Prerequisites, previous knowledge

Students should have a keen interest in transport phenomena and their description and modelling. Advanced knowledge of thermodynamics, fluid dynamics, heat transport and applied mathematics (ordinary and partial differential equations, algebraic equations, integral calculus) is of great benefit for students.

Brief course description of module objectives and content

This module deals with transport phenomena at postgraduate level with a focus on technical problems in material, heat and momentum transport, especially in the environment of multiphase flows. Working on the basis of conservation principles, transport equations are derived in a general form. In order to obtain closed solutions for specific problems, the general balance equations are combined with material laws and also with initial and boundary conditions. This then highlights the analogies and relations between transport phenomena in different technical fields. In this way, students expand the knowledge and skills in thermodynamics, fluid dynamics and heat transport that they have acquired during their

Aims, content, methods

Learning objectives and acquired competencies

- Upon successful completion of the module
 - students are familiar with the most important phenomena of mass, heat and momentum transport (this is the aim pursued in contact teaching, in particular.)
 - the students can independently study similar topics in greater depth (this is the aim pursued through the self-study of selected chapters, in particular.)
 - students are able to apply the methods covered to actual technical problems (this is the aim of the exercises between the contact lessons, in particular.)
 - · students are in a position to conduct analyses independently.

Contents of module with emphasis on teaching content

The first half deals with general transport phenomena (with the focus on mass transport). The second half covers phenomena with multiphase flows.

Teaching and learning methods

Frontal teaching, incorporating examples (lectures with 3 lessons) Self-study of selected chapters from different sources Between the lectures, exercises are to be solved; these will, if necessary, be discussed in class afterwards.

Literature

Experience has shown that the subjects cannot be covered by a single book. Instead, students are told to consult various books. Selected sources are made available electronically:

- presentations from frontal teaching
- selected chapters from textbooks
- selected original works

Assessment

Certification requirements

Module does not use certification requirements

Basic principle for exams

As a rule, all the standard final exams for modules and also all resit exams are to be in written form

Standard final exam for a module and written resit exam

Kind of exam written Duration of exam 120 minutes Permissible aids Aids permitted as specified below: Permissible electronic aids pocket calculator Other permissible aids All documents

Special case: Resit exam as oral exam Kind of exam oral Duration of exam 30 minutes Permissible aids No aids permitted
