

**Module Description, available in: EN**

## *Advanced User Interfaces*

**General Information****Number of ECTS Credits**

3

**Module code**

TSM\_UseInf

**Valid for academic year**

2022-2023

**Last modification**

2021-03-03

**Coordinator of the module**

Hans-Peter Hutter (ZHAW, hans-peter.hutter@zhaw.ch)

**Explanations regarding the language definitions for each location:**

- Instruction is given in the language defined below for each location/each time the module is held.
- Documentation is available in the languages defined below. Where documents are in several languages, the percentage distribution is shown (100% = all the documentation).
- The examination is available 100% in the languages shown for each location/each time it is held.

	Lausanne			Lugano	Zurich		
<b>Instruction</b>					X E 100%		
<b>Documentation</b>					X E 100%		
<b>Examination</b>					X E 100%		

**Module Category**

TSM Technical scientific module

**Lessons**

2 lecture periods and 1 tutorial period per week

**Entry level competences****Prerequisites, previous knowledge**

- Basic principles of human cognition and human-machine interaction
- Basic knowledge of graphical user interfaces and frameworks corresponding to chapters 1-5, 7-8, 11 from Markus Dahm, "Grundlagen der Mensch-Computer-Interaktion", Pearson Studium, ISBN 3-8273-7175-9, 2006

## Brief course description of module objectives and content

Graphical User Interfaces have long become standard UIs for computers, and mobile devices have not only adopted these GUIs but augmented them with multi-touch screens, speech in- and output, gesture and handwriting recognition as well as several additional sensors. This has fostered innovative ways of user interaction with the information available on these devices that were only seen in professional environments so far. In the professional environment the trend has further developed into more and more immersive systems where the user dives more or less completely into a virtual world in order to efficiently interact with the vast amount of available information. In these scenarios, haptic interaction plays a major role. This module gives a solid introduction into the fundamental concepts and techniques of both advanced user interfaces with different input and output channels and interaction modalities as well as immersive systems with haptic interaction. Insight into the development of these advanced user interfaces and immersive systems will be given through hands-on exercises and a lab visit.

## Aims, content, methods

### Learning objectives and acquired competencies

Students attending this module

- have complemented their knowledge about the user-centered UI design process and its major activities
- are familiar with a wide range of non-standard and advanced user interfaces and can discriminate and explain their characteristics, strengths and limitations
- possess a sound knowledge of the principles and (potential) application areas of non-standard user interfaces such as voice, gesture-based or haptic user interfaces as well as immersive systems and technologies
- know the required components and underlying technologies for these advanced user interfaces and are able to evaluate and design simple applications
- have extended their knowledge of user-centred design and usability to environments and applications using non-standard user interfaces and can evaluate their suitability for specific tasks or projects

### Contents of module with emphasis on teaching content

- The User-Centered Design Process (15%)
  - Fundamentals of Human-Computer Interaction (Recapitulation/Convergence)
  - UI Requirements Elicitation & Analysis: Stakeholders, Users, Business, Tasks and Context
  - UI Design & Evaluation: Principles, Patterns, Guidelines, and Techniques
  - Aligning with the Software Engineering process
- Recognition Based User Interfaces (50%)
  - Fundamentals of recognition-based UIs (Hidden-Markov Models, Deep Neural Networks)
  - Conversational User Interfaces
  - Gesture Recognition, Handwriting Recognition
  - Multimodal Interfaces, Brain Computer Interface
- Immersive Systems (35%)
  - Fundamentals of Virtual Reality (VR), Augmented Reality (AR) and Mixed Reality (MR) systems.
  - Technology for VR applications (human depth perception, 3D stereoscopic and volumetric displays, tracking and motion capturing technologies, locomotion interfaces)
  - Introduction to 3D computer graphics (rendering pipeline, photo-realistic and non-photo-realistic rendering, ray-tracing, particle systems, volume rendering)
  - Computer Haptics (human haptic perception, computer haptic interfaces, haptic rendering and applications)

### Teaching and learning methods

- Ex cathedra
- Self study of literature / publications
- Practical exercises

### Literature

## Assessment

### Certification requirements

Module uses certification requirements

### Certification requirements for final examinations (conditions for attestation)

Attendance at practical exercises. Labs will be graded. The lab grades will account for about 20% of the module grade.

## Basic principle for exams

**As a rule, all the standard final exams for modules and also all resit exams are to be in written form**

## Standard final exam for a module and written resit exam

### Kind of exam

written

### Duration of exam

120 minutes

### Permissible aids

*Aids permitted as specified below:*

#### Permissible electronic aids

No electronic aids permitted

#### Other permissible aids

- Slides

- Own lecture notes

## Special case: Resit exam as oral exam

### Kind of exam

oral

### Duration of exam

30 minutes

### Permissible aids

No aids permitted
